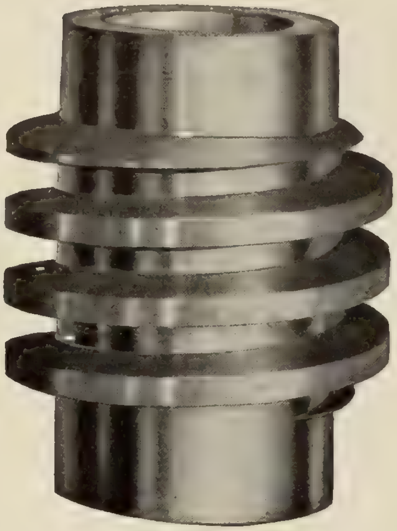
Best For Milling Threads On

Auto Steering and Elevator Worms, Spindle Noses, Feed and Lead Screws, etc., etc.



Let us prove to you that the most rapid, accurate and efficient method is by means of

P. & W. Thread Milling Machines

The efficiency of these machines on this class of work is being demonstrated in many of the largest shops in the country. Send samples or drawing and we shall be glad to tell you what the P. & W. Thread Miller will do on your work.

Smooth, Accurate Threads At One Cut

The rigidity of the design and accuracy with which these machines are built and aligned, gives a smooth, accurate thread at one cut.

One Man Can Operate Several Machines

The automatic features of the P. & W. Thread Milling Machine enables one man to keep several machines busy, which makes possible a very large output.

Write for catalog, "Thread Milling Machines" — fully describing all sizes.

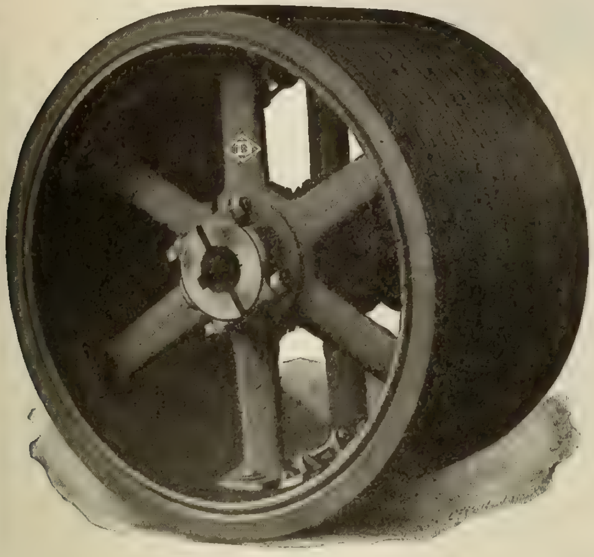
The Pulley Without a Peer



DODGE
IRON CENTRE WOOD RIM PULLEY

¶ The combination of wood and iron is an engineering triumph. The wood rim gives high tractile efficiency, tests showing that it is superior to iron in the proportion of 46 to 22. Lighter belts and less tension can be used thereby minimizing pressure on bearings, all of which decreases friction.

¶ It can be run at a higher speed than any other pulley, — one of these pulleys was tested to a rim speed of five and a half miles per minute without any resultant damage.

¶ Made solid and split in all sizes to twenty feet in diameter, for any strength, for any speed and for any service for which belting can be used. It is a pulley that is quite in keeping with the other members of the famous Dodge Line of Power Transmission Equipment.

KEMPSMITH MANUFACTURING MILLER

No. 2-A Plain

Longitudinal table feed of a No. 3.

Price less than a No. 1.

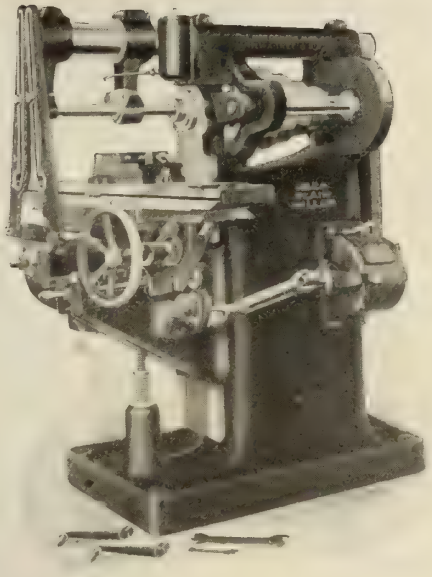
There are no different grades to the quality of Kempsmith products. This manufacturing miller is built with the same care and precision as our tool room millers.

Convenient to operate.

Positive longitudinal table feed.

Quick return to table by means of the hand wheel.

Write to-day for descriptive circular.



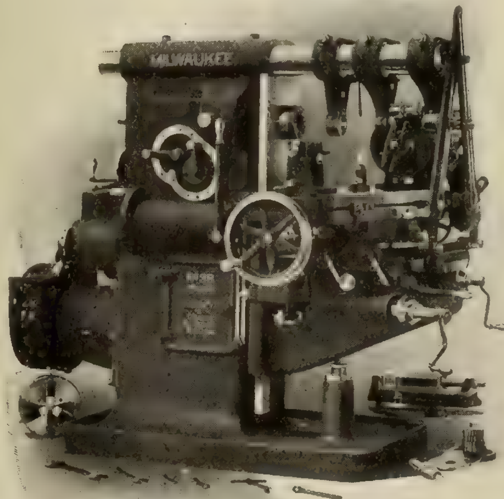
THE KEMPSMITH MFG. COMPANY

MILWAUKEE, WISCONSIN

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 1. The Column

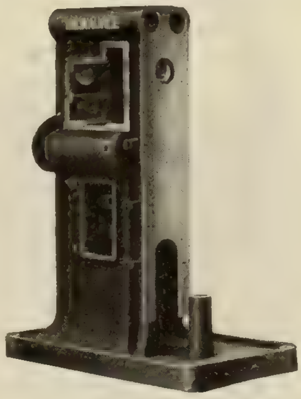
The ability to maintain the same alignment between the cutter and work, when subjected to the severest strains, as existed when the work was set up and cut not yet started—that's the dominating essential of a milling machine.



To fill the bill in this respect the machine must have, first of all, **back-bone.** Its column must be right.

The column of the Milwaukee Miller is cast in **one** piece with strong internal ribs. It is a box section of increasing depth as it extends downward to the pan-shaped base—this being given sufficient height from the floor to allow heavy ribs to be used and to render masonry foundations unnecessary where the floor is strong enough to carry the load.

The openings in the column are as few and as small as is consistent with ready accessibility to the parts contained within, and these openings are all closed with well fitted plates or brackets, screwed and doweled in place so that the finished column is a box section, in fact oil tight and entirely closed.



We're starting right at the foundations and will give you a "WHY" in favor of Milwaukee Millers each week. Our Catalog gives **all** the "WHYS" **all at one time.** Shall we mail you a copy?

Concerning Hack Saws

No. 102
STARRETT

The best is recognized by its rapid cutting and lasting qualities. The best is recognized by the name

Starrett

Every Tooth Cuts:

Think how much more work this saw does than one having one tooth in ten doing the cutting.

Every Tooth Has the Right Shape:

The square cutting edges are at the angle which will cut fastest in the metal for which the blade is made.

Every Tooth Has the Right Set:

You save material because the set is only enough to clear freely. You save strength because you don't cut up a large amount of metal.

Before buying consult our catalog No. 193—it's yours for the asking.

The Refining Process

Individual excellence is purely a matter of taking one's self through a refining process. Every healthy human being is fitted out with the same flesh, blood, bone and brain, the necessary material to become a refined, finished product.

¶ A piece of iron that will make twelve dollars worth of horse-shoes will make twenty-five thousand dollars worth of watch springs. A piece of ordinary coal is formed of the same substance we find in a diamond, the only difference is nature has carried the diamond through a more extensive process of refinement.

¶ Every healthy human being is fitted out with the necessary material to arrive at efficiency and excellence, with the necessary equipment to become a finished product. It is purely a matter of the refining process through which you are bringing yourself. The same constituents are found in the flesh, blood, bone and brain of every man.

¶ We are a combination of certain forces, and these forces are guided, controlled and dependent on physical form. The same wasted life, the same abuse of nature, the same negligence of mind and body that destroys the lustre of the eye and deaden the clearness of the voice, are the same things which deprive us of the opportunity to reach proficiency. In other words to become an efficient human being.

¶ The world is filled with people who do a little bit of everything, but who are not able to do anything worth while. Many women who can play a note or two of a good musical selection, who can sing a few lines of grand opera, have only dabbled in something they will never have the patience and care to complete.

¶ We find men who have ideas which are to a certain extent usable, but coupled with inconsistency and eccentric notions that destroy their utility. A few days ago a prominent business man said that Greater New York was crowded with stenographers, and only a few efficient dependable men and women in the business, but thousands of inefficient, incompetent people who would always be nothing short of failures.

¶ Excellence is not attained because people do not attempt to attain it. If you wish to find someone for an important position you will discover in your analysis of applicants that one lacks knowledge of words to express ideas, another lacks executive ability, another has certain weaknesses which do not inspire confidence in other men.

¶ If you do not do well the thing you have right at hand, there is no way of knowing that you will ever do a bigger thing any better. The chances are that you will not be able to handle more important responsibilities, because you have not trained yourself to handle less important ones. Our business institutions are filled with young men who expect opportunity to come to them by night and thrust them forward in life by some mysterious force or power.

¶ We find men on the street corner discussing the affairs of Government, suggesting a solution of "woman's rights," advising the Government how to fortify the Panama Canal, who actually do not know how to prepare a list of names, write a business letter or collect an account.

¶ What the world needs is refinement of purpose, refinement of body, refinement of mind, refinement of intention, refinement of system and order, conduct and character, and fewer men and women engaged in directing the Government, outlining a policy for the Navy and deciding the questions of immortality and reincarnation.

¶ *And the moral is*: The most pitiful condition in which a man can find himself in middle age, is *the condition of mediocrity*—that state in which you are a cobbler, a bungler, a combination carpenter, gardener, shoemaker, painter and district magistrate.

Efficiency

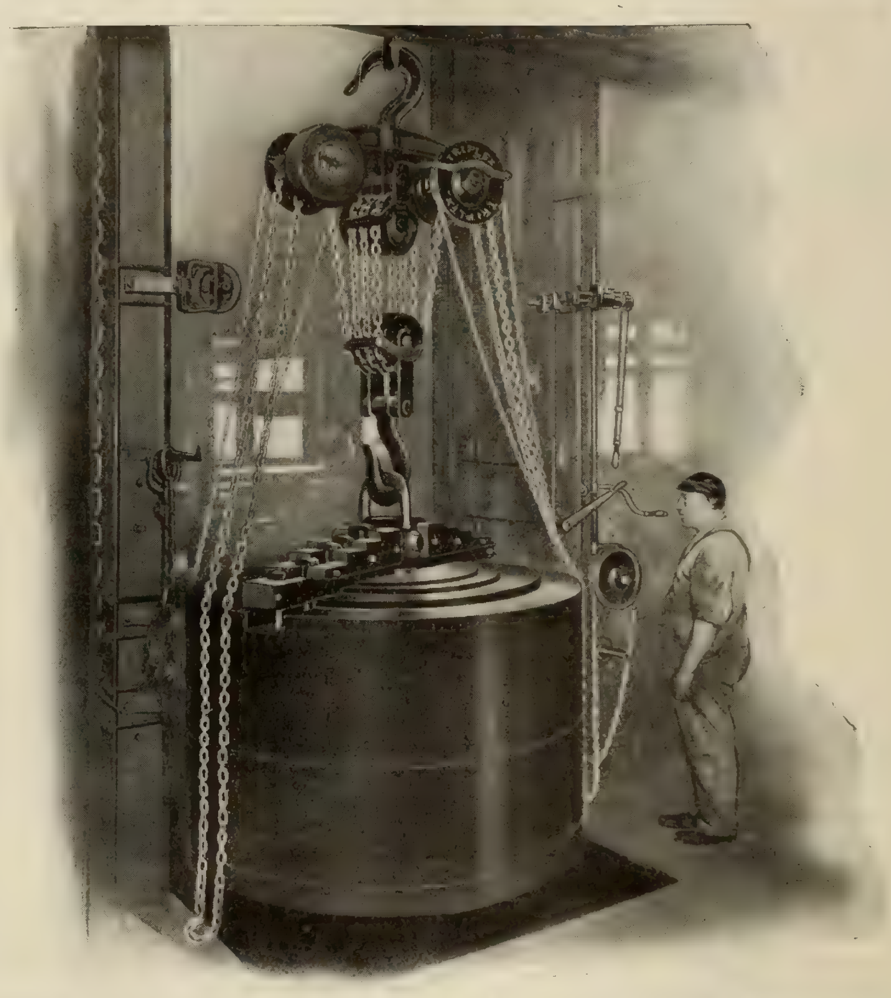
THE TRIPLEX BLOCK



Testing the Safety of each block, by overloading it 50% in long tons in the Yale & Towne factory.

Why the Overload Test is so Important

If a 2-ton load, being lifted by a chain block, should adjust itself in its sling and have a free fall of less than one-quarter of an inch, it will strike the entire block and chain a drop hammer blow of 6,000 lbs., and unless that block has been built, rated and tested for a fifty per cent. overload, an unrevealed defect will cause it to fail and come down with the load. It may crush the life or the limb of the worker. Prevent this harrowing experience. It will surely come with untested chain blocks.

YALE & TOWNE
HOISTS

Unknown defects must cause them to collapse under 6,000 lb. blows.

Triplex Blocks are absolutely safe to the user, for all load bearing parts are steel—steel hooks, steel gears, steel chain, steel load sheave and steel driving pinion. The only chain blocks built in America tested to overloads 50 per cent above rating, to reveal all defects, are the chain blocks built by Yale & Towne.

Send now for your copy of the Book of Hoists. It is an illustrated engineering report of safe handling practice.

EVERY BLOCK TESTED TO 50 PER CENT. OVERLOAD.

TRIPLEX BLOCKS { 16 Sizes: One-quarter of a ton to forty tons.
300 Active Stocks all over the United States and Canada.

Also Duplex Blocks, Differential Blocks and Electric Hoists.

Data Relative to Case-Hardening Equipment and Practice

By Frank Walker

Case-hardening of machine parts forms not the least important operation which contributes to the life and efficiency of the completed unit, whether the latter be a steam engine, a machine tool or other mechanical, electrical or hydraulic engineering product. A careful study of the information given in the article will be found instructive and profitable.

THERE are many parts of machinery at work under conditions which require that they possess great surface hardness, combined with sufficient strength to resist high torsional, tensile, or shearing strains, and to provide for such purposes no process has been found to meet the requirements so fully as that known as "case-hardening." In some instances the conditions can be met by the use of high-grade carbon or alloy steels, but in many cases, the use of these steels is not desirable, inasmuch as their high price, the difficulty of machining them and the complex heat treatments necessary to obtain from them the results required, prohibit their use in those machines which are designed to be sold in a competitive market.

The Genesis of Case-Hardening.

Case-hardening means, as the term implies, the hardening of the outer skin or "case" of the article, and in order to fully understand the process, one must go back to the earliest method of producing tool steel, and study the laws which govern it.

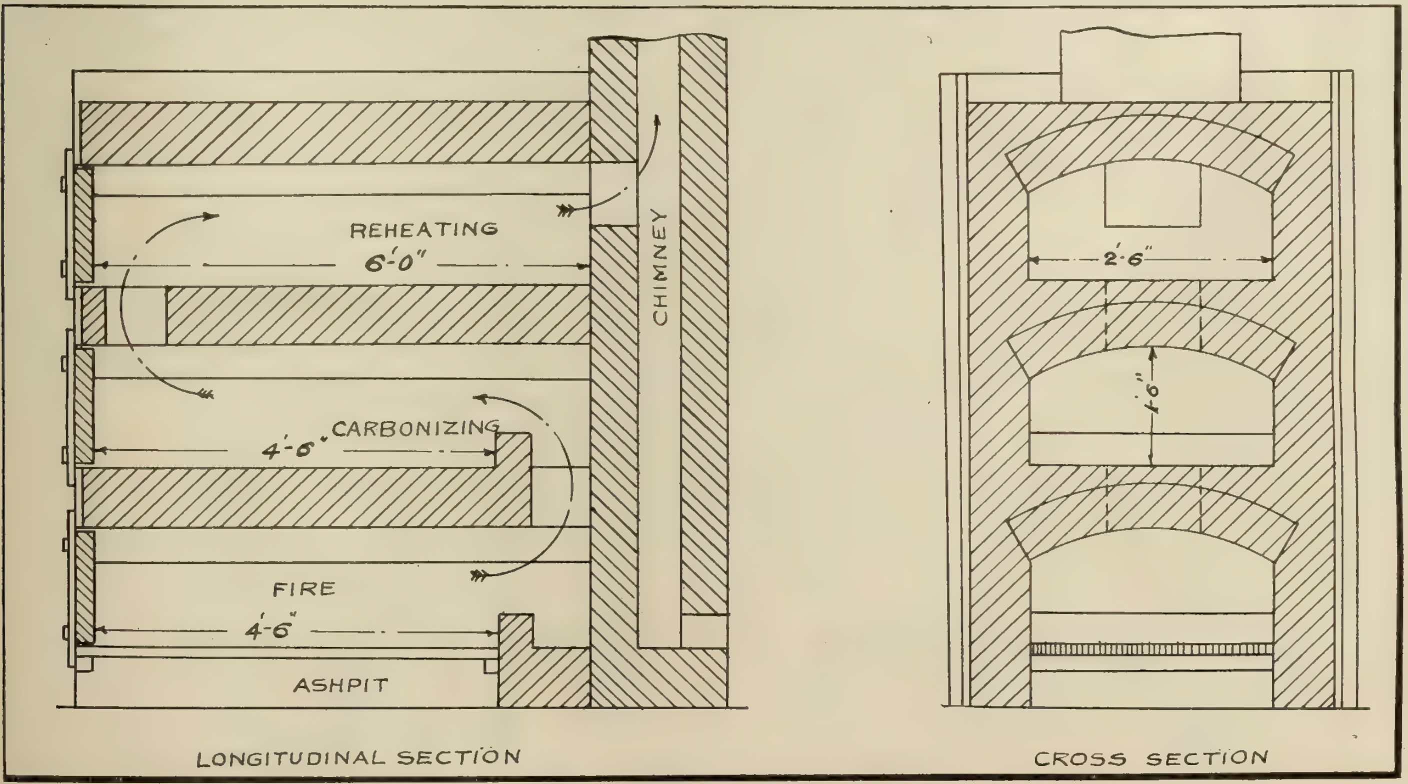
Carbon has a strong affinity for iron, and combines with it at all temperatures above 1300 deg. Fah., that is, at a dark red heat, therefore, if a piece of iron is packed in a muffle with some carbonaceous material, such as pulverized animal or vegetable charcoal, and subjected to the above or a higher temperature, it will absorb carbon in direct proportion to the heat applied and the length of time it is subjected to such an application. It must, however, be understood that temperature is the factor which governs the percentage of carbon absorbed, and time is the factor which governs the depth to which absorption takes place.

Absorption commences, of course, at the outer surface of the iron, and continues gradually inwards until the whole of the metal is carbonized, but if the temperature is held at, and not allowed to rise above, 1300 deg., the amount of carbon absorbed by the iron, even when completely saturated, will be no more than 0.50 per cent. Should the temperature be held at 1650 deg. Fah., the amount of carbon absorbed will be about 1.50 per cent., and at 2000 deg. about 2.50 per cent. These results are only obtained when the piece of iron has become carbonized to its centre, or saturated, and can contain no more carbon at the given temperature.

In the manufacture of carbon steel this process is called the "cementation process" and the resultant steel is called "blister steel." This is cut into small pieces, melted in crucibles and cast into ingots, which can be tilted or rolled into bars of the desired size. Case-hardening is actually an incomplete cementation process, for it will be seen that if the process is arrested before the action is complete, the central portions of the iron must contain less carbon than the outer, and this is the fundamental principle of case-hardening.

A Two Stage Process.

The process is completed in two stages, first, carbonizing the article to the required degree and depth, and then hardening the carbonized portions by heating and quenching. If properly carried out, it will be readily understood that an article, such as an eccentric rod pin, may be manufactured from an inexpensive, easily manipulated material possessing high resisting properties, and afterwards hardened on



CASE-HARDENING FURNACE.

its surface to resist wear, while retaining in inner portion all the original toughness of the material. Articles may be case-hardened locally by covering those portions which are required to be left soft with a coating of fire clay.

Emergency Method.

A rough and ready method of case-hardening, and one that is very useful in an emergency, is to heat the article to a cherry-red (about 1650 deg. Feh.), dust with powdered prussiate of potash, allow it to cool down to a dull red, and then quench in water. This gives but a very slight depth of hardening and should not be attempted for anything but emergency repairs.

Experience and Equipment Features.

To case-harden successfully and effectively requires considerable experience and some outlay for special appliances, but that the results will more than justify this expenditure is instanced by the fact that the process is, and has been for many years, practised by machinery builders all over the world. The appliances necessary to obtain the most satisfactory results are very similar to those required to harden and temper carbon steel, and comprise furnaces, cooling baths, pots and muffles to contain the articles to be hardened, and means by which the pots and their contents can be handled when hot.

The Furnace Equipment.

The furnace should be built on the lines of the sketch given herewith; this furnace gives good results, is easy to manipulate, and costs little to build. The lower chamber is used for carbonizing and the upper one for reheating for hardening. Its size must, of course, be governed by that of the articles to be treated, but it will be found that the dimensions given will cover a large range of general work.

A small sight-hole, about 1½ inches diameter should be pierced in each door in order to provide means of judging the temperature by the eye, and the stack should be fitted with a damper by means of which the temperature may be regulated. The quenching trough should be of ample size, and placed as close to the furnace as convenient. A sufficiency of tongs, etc., should be provided to admit of the work being handled expeditiously and also some method by which the packed pots may be charged into the furnace, and drawn from it when hot. The case-hardening plant should be housed in a separate room adjacent to the machine shop, and it should be remembered that for this class of work, ventilation is of more importance than light.

Carbonizing Pots.

The carbonizing pots may be either of cast or wrought iron, but the latter will be found to be best, for although their first cost is higher, they last far longer than the cast ones. They should be rectangular in shape, and have a plate lid fitting snugly inside. This lid or cover should have three or four ¼-inch holes drilled in it, near the centre. The pots should not be made to hold too many articles, as there is great risk of those in the middle of the charge not being carbonized to the proper depth; this, however, is one of the points which must be regulated by experience only.

Carbonizing Mediums.

The best carbonizing mediums to use for wrought iron or machinery steels containing 0.15 to 0.20 per cent. of carbon are charred leather or charcoal. The leather should be clean new cuttings and pieces, charred black and crisp and granulated till it resembles in size grated bread crumbs. The charcoal, preferably of hardwood, may be ground to a fine powder. No form of bone should be used in case-hardening, as bone contains a high percentage of phosphorus, which will be absorbed with the carbon, and have a tendency to make the work weak and brittle or as it is called, ''cold short.''

Packing the Pots.

Theoretically, the perfect carbonizer should be a simple and pure form of carbon, and leather or hardwood charcoal will be found to give the best and surest results. In packing the articles in the pots for carbonizing great care must be exercised, and the method should be as follows:—

First, place a layer of carbonizer in the bottom of the pot 1½ inches deep and well pressed down. Upon this, having first cleaned them perfectly free from dirt and grease, place the articles to be carbonized, with not less than 1½ inches between those on the outside and the walls of the pot, and about 1 inch between each article; then sift on carbonizer till the whole of the articles are covered to a depth of 1½ inches. Press the whole down firmly, taking care, however, not to disturb those articles already in position. Now, place another layer of articles, and continue as before, until the pot is full, leaving room, however, for 1½ inches of carbonizer between the cover and the topmost layer of pieces to be heated. The cover should then be put on and pressed down firmly, and the joint well luted with fire clay.

Through the holes in the cover 3-16 inch wires should be passed, long enough to reach to the bottom of the pot, and to stand out 1 inch above the cover, and in packing care must be taken to leave room that these wires or test rods can be pressed to the bottom of the charge without coming in contact with any of the articles. One or two small test pieces, say ½ inch round by 4 inches long should also be packed in about the middle of the charge. The pot is now ready for charging into the furnace.

The Charging Operation.

The furnace should be raised before charging to a temperature of 1830 deg. Fah. (a bright cherry red), and this temperature must be maintained with great regularity throughout the operation. The pot should be so placed in the furnace that heat can circulate underneath as well as around it, and to this end it should be allowed to rest on short cast iron or fire brick stands.

Timing the Carbonizing Period.

The timing of the carbonizing period should commence when the contents of the pot have become heated through to a full red heat, and this can be easily ascertained by means of the test wires; When it is thought that sufficient time has been given for the heat to soak through, draw a test wire by means of a long pair of tongs. If not sufficiently hot, wait awhile before drawing another wire. When the wire shows a full red throughout, time from that.

The length of time required for carbonizing depends upon the depth of casing required, and also upon the size of the articles being treated, and must be left to the judgment and experience of the operator, but, as a guide, it may be stated that a piece of wrought iron, ⅝ inch diameter will carbonize to a depth of 1-16 inch in 6 hours at a temperature of 1830 deg., and the amount of carbon absorbed will be about 0.80 per cent.

Carbonizing Completion.

At the close of the carbonizing period the pot must be withdrawn from the furnace and allowed, with its contents undisturbed, to cool down to atmospheric temperature in a dry place, the articles should then be removed and brushed clean of any carbonizer that may adhere to them.

If the packing of the pot has been properly done and no air spaces left between the contents, the articles will be found to be coated with a pure white film with occasional markings of deep blue; should they show red marking, it shows that the packing has been defective, and the deeper the red the more imperfect has been the operation.

The carbonizing having been completed the articles must now be hardened. The hardening process should be carried out with the same care as the hardening of carbon steel, for it must be remembered that the surface of the articles has now become high-grade steel with a carbon content of from 0.75 to 0.85 per cent.

In former days it was customary to dump the contents of the pot into cold water as soon as it was drawn from the carbonizing furnace. This gave satisfactory results to a certain extent, but it has been found that by adopting careful scientific methods, greater hardness of case, combined with greater toughness of core, is obtained. When hardening articles of carbon steel the following points must be borne in mind:

Pointers in Hardening.

They should be heated by radiation, and not by direct contact with the fire from atmospheric temperature to a point slightly higher than the "point of decalescence," as the critical period, when the chemical change in the carbon takes place, is called. The heating should be done evenly, and the articles should be quenched on a rising heat in rain water which should be held at a temperature of about 47 deg. Fah. Carbon steel should never be quenched on a falling heat, that is, raised to a much higher temperature than its critical point and then allowed to cool down to the right heat and quenched. If this be done, the steel, though it may be hardened to a certain extent, will be weak and brittle, showing a coarse fracture. The only excess of temperature which may be permitted should be just sufficient to insure that the change has taken place throughout the piece, and 5 or 7 degrees is ample for this.

The "point of decalescence" varies slightly with the percentage of the carbon content; the greater the percentage of carbon, the lower the temperature of the critical point, and for steel containing 0.80 per cent. of carbon, it occurs at 1465 deg. Fah. Bearing these points in mind, the hardening of the carbonized articles should be carried out as follows:—

Hardening Process.

The articles must be packed in muffles and charged for heating into the upper chamber of the furnace. They should be heated not too quickly, but steadily and evenly, to a temperature of 1470 deg. Fah.—a dull cherry red—then be drawn separately and plunged into a trough of rain water, the temperature of which should be from 45 to 50 deg. Fah. The article should not be held stationary after plunging, but moved slowly from side to side until it has become cooled down to the same temperature as the water. By following these instructions the best and surest results can be obtained. The test pieces which were packed with the charge should be hardened with the same care as the other articles, and when broken will show the depth of the hardened case.

The Test Piece Feature.

At the establishment where the writer first became familiar with the process, it was customary to pack two test pieces with each charge, one of which was hardened and broken to ascertain depth of case, while the other was filed to remove 1-16 inch of its diameter; the filings being carefully collected and analyzed for carbon content. Records of times, temperatures, depths and contents were all kept.

It may be that some readers will think that the instructions which I have given for the process are too elaborate and idealistic, but, as I have pointed out in previous papers, carbon steel is an extremely delicate material to treat, and much greater satisfaction will be obtained by careful methods, than by the old "guess and guard" processes which are practiced in many establishments, and which are more productive of misses than hits in obtaining results.

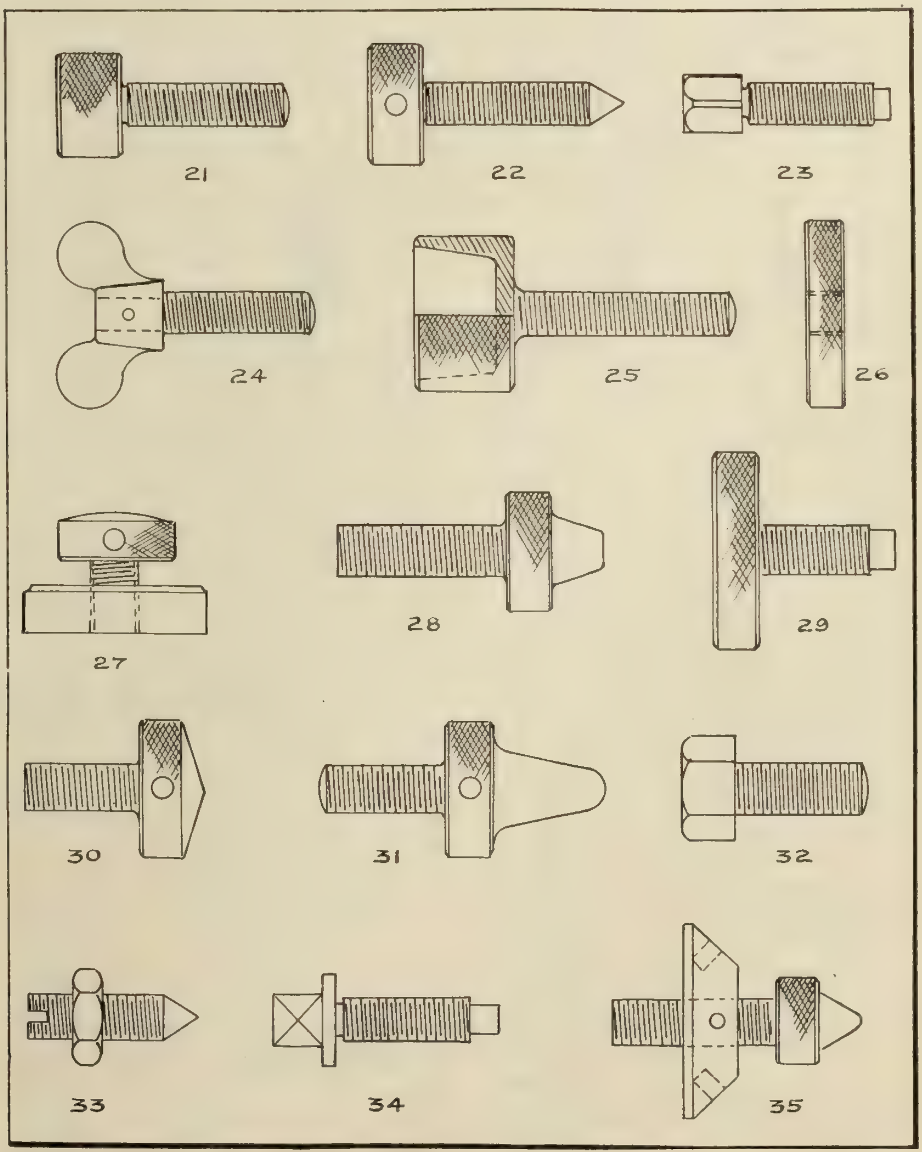
Drill Jig and Fixture Design and Construction

By H, R.

The sketches and data will, the writer hopes, appeal to machine shop superintendents, designers, toolmakers, and novices, as indicating the large place jigs of every kind and for every service occupy today in machine shop practice.

THE sketches here illustrated show different styles of screws and nuts, which are not only used for drilling jigs but are equally adapted to other jigs and fixtures.

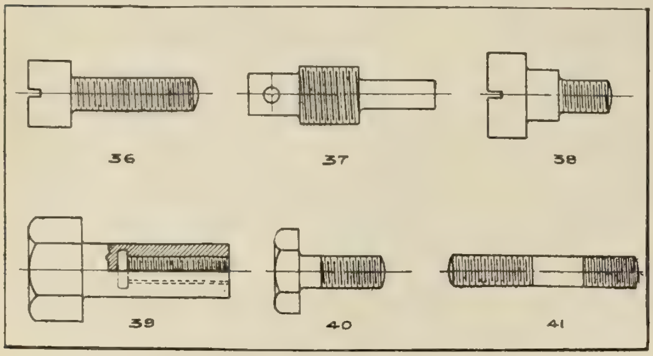
No. 21 is very commonly used in all



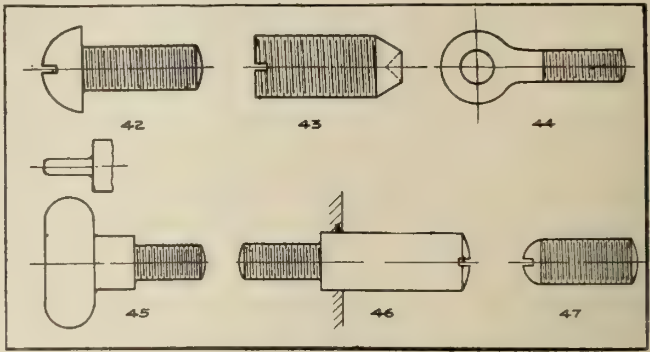
SCREWS AND NUTS FOR JIGS AND FIXTURES.

jig and fixture work where the pressure required is very slight, a stock of these being usually kept in standard sizes of ⅜ in., ½ in., and ⅝ in.

No. 22 is of the same type as No. 21 but has a pointed end which is good for some work, and a tommy bar hole enables additional pressure to be put on.

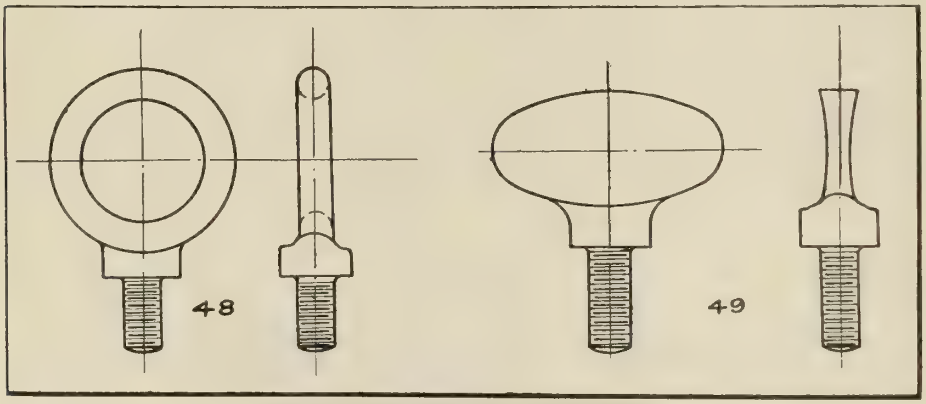


SCREWS FOR JIGS AND FIXTURES.



SCREWS FOR JIGS AND FIXTURES.

No 23 shows a common square headed set screw with a flat pivot-ended point. This is used where the space for holding down the work is limited, and it would be impossible to have a projecting head.



SCREWS FOR JIGS AND FIXTURES.

No. 24 is a made-up wing screw. It will be observed that any size shank can be pegged into a wing nut to suit the particular job, and some nut and bolt manufacturers make a speciality of supplying these in drop forgings. Of course the wing nut can be adapted to quite a few different jobs.

No. 25 depicts a lightened out screw for very fine or light work.

No. 26 shows a very suitable locking nut that can be used on most of the screws shown in this article.

No. 27 is a combination of a screw and base plate with tommy holes, being used for jacking or levelling up work on jigs and fixtures. This is especially adapted for plate jig work where the piece to be operated upon only requires a small plate jig to do some particular hole, and where a large jig is unnecessary.

No. 28 is a screw for binding purposes, also No. 30 which has a conical top and tommy holes.

No. 31 is of the same principle as No. 28, but with a long round nose end and tommy holes.

No. 29 is of the same design as No. 21, but it will be noticed that it has a large diameter head for extra leverage, and is made rather thin so that it is suitable for jigs that have to be drilled on all sides. This means that the screws have to be as short as possible on the overall length, while the feet on the jig are at their minimum depth.

No. 32 is the commonest of all screws, but universally used in jigs and fixture work.

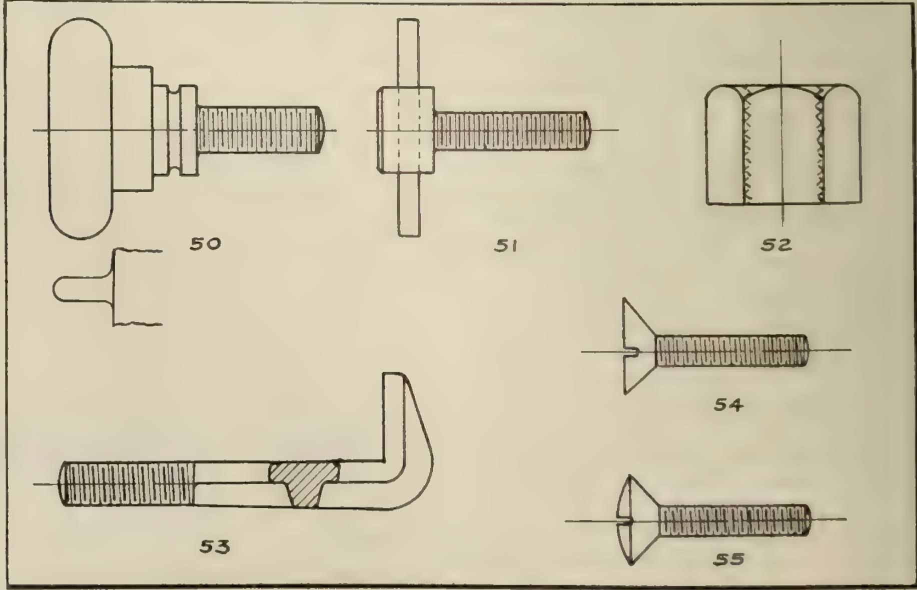
No. 33 is a locating point headless set screw, and is used for a locating point that will need possible adjustment, being afterwards locked up for a permanent point by the lock nut.

No. 34 is a flange headed set screw, and its use will be better appreciated by a sketch in a following contribution.

No. 35 is a very useful type of binding screw and lock nut. It is especially adapted for working in very close places, and enables the lock nut to be screwed up easily. The face of the nut is set on an angle, being better than on the periphery, and, if necessary, the face of the screw can be made the same way.

Binding and all screws should be made in various sizes and with threads to conform to the standard taps with which the shops are provided. When drills of a very large size are used, a screw with a hexagon or square head is best, as the work requires firm clamping. If the drills used are small, the winged nut or screw or the screws which are simply screwed up with the fingers will be sufficient and more convenient, as they will require less time to manipulate.

No. 36 shows a fillister headed screw. This is very largely used in built-up jig work for screwing plates together. The heads are very often sunk flush with the top of the plate.



SCREWS AND NUTS FOR JIGS AND FIXTURES.

No. 37 shows a useful plug screw, the long shanked end being ground to the size of the hole in the work for which same is intended.

No. 38 is a fillister headed screw with a shoulder. This is used mostly in swing straps where there has to be a certain amount of clearance to allow for swinging these straps, and yet not unwind the screw.

No. 39 is a special nut which can be used to advantage where the stud has to be very short, yet obliged to get down to the work.

No. 40 is a thin-headed set screw used for slot work.

No. 41 is the common screwed stud.

It may be mentioned that to screw a stud into a casting permanently, and holding down the work by a nut is much better than screwing a set screw into a tapped hole. This means that if the threads of a tapped hole get worn by constant use, same will have to be tapped out to a large size to accommodate a larger screw. If a stud be used, and the threads get worn, it simply means that a fresh stud can replace the old one of the same size, or a new nut as the case may be.

No. 42 is a round-headed cap screw which is used in place of the fillister head when same cannot be sunk into the metal.

No. 43 shows a cup-point headless screw, useful for centering work.

No. 44 is an eye swing bolt largely used with winged nuts and where it is necessary to swing the clamping bolt out of action. This means the saving of a lot of time unscrewing the whole length of the thread.

No. 45 is what is termed a locking jig screw, and is used in conjunction with slotted clamps to be shown later.

No. 46 is a plain-shanked screw, and the illustration shows the best way of setting into the casting.

No. 47 is another type of binding screw very commonly used, while No. 48 shows an eye bolt. These will be appreciated by operators where the drill jig is very heavy. By putting one or more of these into a jig, it can be readily moved about without a lot of trouble.

No. 48 shows another type of thumb or wing screw, while No. 50 is a screw very commonly used for the moving of various wedges to be described later.

No. 51 shows a screw with the tommy bar a fixture.

No. 52 is a nut which it will be noticed is rather thicker than the usual standard. This is for very heavy work such as the clamping of big castings.

No. 53 shows what is termed a hook bolt, but should not be used where it is possible to put a better bolt. If it be used, the back should be backed up so as to prevent possibility of the bolt springing from its work.

No. 54 is a common type of countersunk screw, adapted for screwing down thin plates.

No. 55 is the French-headed screw, but very little used in jig work.

The World's Metal Production, Consumption and Stocks

The "Engineer"

The return which is now made for the nineteenth year, states that the consumption of metals in 1912 *underwent such a large augmentation in general, that it was temporarily impossible for the production to keep step with the demand, notwithstanding the considerable expansion in the output.*

ATTENTION is drawn to the well-known statistics issued by the Metall Gesellschaft of Frankfort-on-the Main regarding the production, consumption, and stocks of copper, tin, lead, zinc, and other metals.

Copper Production.

The return shows that the production of copper throughout the world in 1912, exceeded 1,000,000 tons for the first time in history, the quantity having been 1,019,800 tons, as compared with 893,400 tons in 1911. The figures represent an increase of 14 per cent., whereas those for 1911 only experienced an advance of 6 per cent. over the preceding year. As to the distribution of the tonnage among the different countries, it is mentioned that a considerable extension of the production took place in America, the North and South of which yielded 707,900 tons for the market, or 69.4 per cent. of the world's output. This quantity was 93,000 tons in excess of 1911.

The chief share of the increase devolved upon the United States, where the copper works produced 592,400 tons, as contrasted with 518,700 tons in the preceding year, the mines output alone being 563,800 tons, or 14 per cent. more than in 1911, so that these mines provided 55 per cent. of the world's production. The augmentation applied to a large extent to the new mines in Arizona and New Mexico, while the output in Utah and Nevada was largely hampered by labor troubles.

The imports of raw copper, and the native production combined, totalled 730,900 tons, as against 639,300 tons in 1911, which were delivered to the refineries for treatment, but according to the United States Official Statistics, the output of refined copper amounted to 717,600 tons, as compared with 649,500 tons in 1911, the former being equal to 70 per cent. of the world's production; 584,400 tons of the quantity were electrolytic copper. It is expected that the unrest in Mexico will prejudicially affect the development of the output of copper in the present year, but the forthcoming opening of the Panama Canal will be conducive to the advancement of the working of the deposits of ore in South America, in which an increasing interest continues to be shown.

The production of raw copper in Europe is returned at 197,000 tons for 1912, as contrasted with 181,500 tons in 1911. Russia is credited with 33,000 tons of this total, as against 26,600 tons in the previous year, and a further advance is considered probable. The exports from Spain were 23,300 tons, as compared with 18,300 tons, the increase mainly concerning the Rio Tinto mines. Germany produced 39,800 tons, as against 37,500 tons; and Great Britain 63,200 tons, as contrasted with 67,700 tons in 1911. This represents a further decrease for Great Britain, which occupied the second place among the raw copper-producing countries until last year, when the position was secured by Japan. The output of the latter country rose from 55,000 tons in 1911, to 67,000 tons last year, and that of Australia from 40,000 tons to 44,900 tons in the two years respectively, but the hopes entertained with regard to the development of the copper deposits in the Katanga district of the Congo have hitherto not been realized.

Concerning the world's consumption of copper, the return gives the total at 1,040,000 tons, as contrasted with 953,700 tons in 1911, and as the former was much greater than the output, the world's stocks had to be drawn upon to the extent of about 21,000 tons.

Lead Production.

The world's production of lead, which next receives the attention of the return, and which remained almost stationary in 1911 in relation to the previous year, increased from 1,132,000 tons in 1911 to 1,189,100 tons last year. Of the European countries, Spain was responsible for exports of 186,700 tons in 1912, as compared with 175,100 tons; Germany produced 165,000 tons, as against 161,300 tons; Belgium, 57,100 tons and 44,300 tons; France, 33,000 tons and 23,600 tons; and Great Britain, 29,000 tons and 26,000 tons in the two years respectively. The leading position was sustained by the United States with 388,700 tons, as contrasted with 377,900 tons, Mexico apparently ranking second with 120,000 tons, as against 124,000 tons in 1911. On the other hand, the world's consumption of lead reached 1,198,000 tons in 1912, as contrasted with 1,157,700 tons in 1911, and the inadequate supplies, in face of the urgent demand, caused a large decrease in stocks and forced prices to such a high level as has not been recorded since 1873.

Tin Production.

The increase in the production of tin from 118,700 tons in 1911, to 123,100 tons in 1912, almost entirely devolved upon the Straits Settlements, which raised 61,528 tons in 1912, as compared with 57,944 tons in the previous year, whilst Bolivia occupied the second position with ore equivalent to 23,000 tons of tin, as contrasted with 22,200 tons in 1911. On the other hand, the world's consumption advanced from 120,600 tons in 1911, to 128,100 tons in 1912, only 2,400 tons of the increase applying to Europe. Germany participated to the extent of 21,700 tons, as against 19,300 tons in 1911; Great Britain consumed 21,500 tons, as compared with 21,900 tons; whilst the United States had a share of 51,700 tons, as contrasted with 48,000 tons in 1911. The augmentation in the latter case is attributed to the large expansion in the American export surplus of tin-plates—83,200 tons, as against 62,400 tons in 1911—to the detriment of the British export trade.

Zinc Production.

In the case of zinc, the production is returned at 977,900 tons in 1912, as compared with 902,100 tons, whilst the consumption amounted to 987,500 tons, as against 903,206 tons in 1911. The following tables show the production, consumption, stocks, and average prices in the past three years, and the respective consumption of the four leading countries:—

Production, Consumption, Prices and Stock.

	1910. Tons.	1911. Tons.	1912. Tons.
COPPER.			
Production in tons .	887,900	893,400	1,019,800
Consumption in ton..	913,700	953,700	1,040,200
Average price	$286	$280	$365
Stocks in tons on January 1st	148,500	102,100	83,400

The output of nickel throughout the world in 1912 amounted to 28,500 tons, as contrasted with 24,500 tons in the previous year, the United States and Canada having been jointly responsible for 15,000 tons and 12,000 tons in the two years respectively, and the average price remained at 80 cents per kilogramme as in each of the three preceding years. A further development took place in aluminum, the output of which reached 61,100 tons, as compared with 45,000 tons in 1911.

The first position is occupied by the United States and Canada, which produced 18,000 tons, as in 1911; France turned out 13,000 tons, as against 10,000 tons; and Germany, Austria, and Switzerland are credited with 12,000 tons, as contrasted with 8,000 tons in 1911. It is calculated that the world's consumption amounted to 61,100 tons, as compared with 46,800 tons in 1911, and 28,000 tons and 20,900 tons in the two years respectively apply to the United States. The average price was 36 cents per kilogramme, this contrasting with 28 cents in 1911 and 35 cents in 1910. In conclusion, the statistics record the production of quicksilver at 4,300 tons, or 200 tons in excess of the previous year, but the figures for silver are not available for 1912.

LENGTH OF LOCOMOTIVE BOILER TUBES.

WHILE no one argues that increasing the length of tubes adds to the steam generative capacity of the boiler in anything like corresponding proportion, there are few engineers, says a writer in the Railway News, who go so far as to claim that, beyond a certain length, the value is almost negligible. A record of experiments conducted at the Altoona testing plant of the Pennsylvania Railroad, recently made public, gives some interesting data concerning the matter.

The temperature observations indicate that the gases entering the tubes are of a lower temperature than is shown by a separate pyrometer placed in the middle of the fire-box. The fire-box temperature ranges from 2,000 to 2,400 degs., while the temperature at the tube ends is from 1,370 to 1,620 degs. They also show that there is a rapid decrease in temperature for a distance of 3 ft. or 4 ft. in the tube, after which the temperature drop is much more gradual, but even with short tubes only 13 ft. 8⅝ in. long, the temperature curve becomes flat towards the end of the tube, indicating that a large part of the heat is absorbed before half the length of the tube is reached.

ELECTRIC WELDING IN LOCOMOTIVE SHOPS.

ELECTRIC welding has been most successful in the locomotive workshops of the Erie Railway. There are eight machines in operation ,and 60 per cent. of the work is on boilers. According to the Railway Gazette, cracks of all kinds in boilers can be welded by this system, and it is the practice to heat up the plate by means of steam on the inside of the boiler before beginning operations. The opening to be filled with welding material is extended clear through the plate and an open space left at the bottom. The weld is carried to a thickness ⅛ in. greater than the plate, and it is very important that the welding material be hammered while hot, and the more promptly this is done, the better the results. There are over thirty full sets of boiler tubes welded to the tube plates in locomotives belonging to the railway referred to, in addition to many partial sets.

The method following on this operation is to set the copper ferrule 1-32 in. back from the edge of the plate, roll it and insert the tube, letting it project 3-16 in. beyond the plate, or ¼ in. in the case of superheater tubes, and after again rolling lightly, weld round the extension and to the plate. After the welding is finished, the work is smoothed off by a special tool and gone over lightly with a beading tool. In welding patches on the side plates of a fire-box, longitudinal seams are generally satisfactory, but vertical seams usually fail after two or three months. The welding of tubes is not advisable in bad water districts on account of the increased difficulty in removing them at frequent intervals.

The Theory and Practice of Screw Cutting on the Lathe

By J. Davies

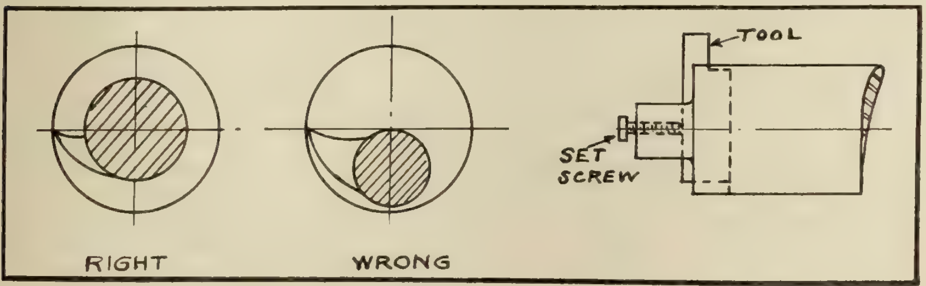
The author of this series of articles intimates his intention of making the information sufficiently simple and clear, that apprentices and others with only the four rules of arithmetic at their command will be able to intelligently grasp the data and apply it in practice.

IN cutting left hand threads the direction of the travel of the tool is generally reversed, either by the reversing quadrant at the end of the lathe, or, if the lathe has no reversing quadrant, by inserting an extra gear in the train of wheels. This is no doubt the best method for shafts, rods, etc., but for some other work it is open to serious objection; for instance, the cutting of a left hand thread inside a long sleeve can best be done by reversing the lathe and commencing the cut at the same end as you would for a right hand thread.

The advantage of the latter is that the lathe hand can see how the tool is operating before it has time to do any damage, in case he should happen to put the nut in gear at the wrong place—a thing that every lathe hand does sometimes. Before I got on to this idea, I saw a man cutting a fine thread in a long brass bush. He happened to put the nut in at the wrong place, and when the tool emerged at the other end the job was spoiled. The above method obviates anything of that kind. When fixing the chuck for a job of this kind, bang it on a little harder than usual, as the cuts tend to unscrew it from the end of the lathe spindle. I have never known this to occur, but it is best to take no chances.

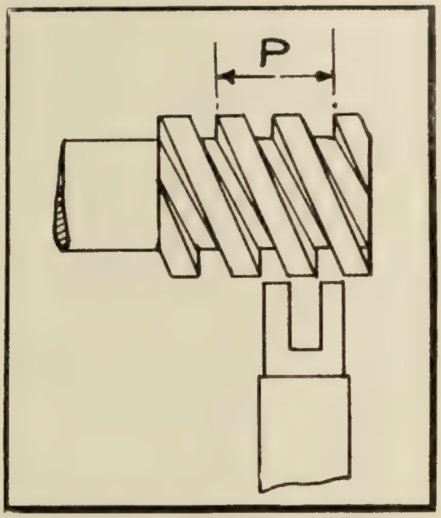
Internal Threading Tools.

Every mechanic knows that the difficulty experienced in cutting a long, small internal thread is due to the spring of the tool, and, while the obvious thing to do is to make the tool as stiff as possible in the round part or shank, yet, strange to say, nine out of every ten operators do not take this into consideration in making or grinding their tools. The cutting edge of the tool in question must be somewhere near the centre of the hole, and if the cutting edge of the tool is in line with the top of the shank it follows that the whole of the tool must be contained in half the diameter of the hole. If the cutting edge of the tool is in the centre of the bar, as it should be, it allows of a much stiffer tool being used.



INTERNAL THREADING TOOL ARRANGEMENT.

In cutting an extraordinarily long hole, it may be necessary to make a boring bar, fasten a tool in by a set screw from the end and push out the tool a little at every cut. If the bar is nearly the size of the hole, it will prevent the bar from springing, but the end of the bar must be reduced past the cutting edge so that the bar will push the cuttings before it. Since it will be impossible in most cases to remove the tool for the return stroke, if there is any slack or backlash in the leading screw, care must be taken of this by the hand.



TOOL FOR COMPOUND THREAD.

Cutting Compound or Multiple Threads.

The usual method employed in cutting compound or multiple threads is to put a wheel on the lathe spindle, whose teeth can be divided by the number of threads we wish to cut, then by marking off the teeth, and lowering the quadrant and turning the lathe round, we can make the number of divisions required. A compound triple or four-start thread can, however, be cut by taking alternate cuts up each thread, without dropping the quadrant, and turning the job through a certain portion of a revolution, or otherwise marking off or measuring the space between each cut when the screw to be cut complies with the following conditions:—

When the thread on the screw to be cut is rougher than the leading screw, and the number of complete revolutions of the leading screw to one revolution of the job or face plate is equal to or a multiple of the number of starts we wish to make, bring the lathe carriage back to the same place every time, and mark off on the face plate as many divisions as you wish to make starts or separate threads. For the first cut, engage the nut when division No. 1 on the face plate is at the top, and the next cut when division No. 2 is at the top, and so on. If it happen, which is often the case, that a compound thread is to be cut whose pitch fulfils the conditions laid down, this is by far the most convenient method.

A compound thread can also be cut at one operation with a tool filed up to suit, provided that the job has sufficient clearance at the end of the thread to accommodate the increased width of the tool. See Upper Figure.

◆

INDUSTRIAL ALCOHOL FOR FUEL.

INDUSTRIAL alcohol can, it is stated, be produced from the refuse of the sugar factories at Demerara at 8 cents per gallon. In addition to sugar, maize is said to be rich in carbohydrates, which yield the highest percentage of crude alcohol. Maize contains 70 per cent. of carbohydrates. Engines constructed for kerosene can usually work with alcohol without any adaptation, and the storage of alcohol is much less dangerous than that of petrol. Alcohol, however, has not the same value per horse-power as petrol, 1.8 times as much being required.

MONTREAL AND TORONTO PUBLIC UTILITIES.

SOME interesting figures have been compiled at the City Hall, Montreal, in regard to the number of Public Companies there, which contribute to the civic exchequer, compared with the number of companies, etc., in Toronto.

There are fifteen of such companies in Toronto, compared with eleven in Montreal. The figures in both instances show just what assessed values are levied on the companies for buildings, land, plant in streets, rails and poles. In some cases, the business tax is also included in Toronto, but in Montreal it is not shown in the total assessments, as the method of levying the business tax is not given under the heading of assessment on property.

Toronto Data.

The following list shows just what companies were taxed in Toronto last year, and the total amount of assessed values in each case:—

Street Railway Co., $2,886,665; Consumers' Gas Co., $4,109,690; Toronto Electric Light, $1,947,918; Bell Tel. Co., $1,663,869; C.P.R. Telegraph Co., $121,042; G.N.W. Telegraph Co., $76,220; Grand Trunk Railway, $5,000,283; Toronto and York Radial Railway Co., $90,632; Toronto and Suburban Ry. Co., $31,400; Inter-Urban Elec. Co., $13,746; Toronto & Western Ry., $2,900; Erindale Power Co., $505; C.N.O. Ry., $199,116; Canadian Pacific Railway, $3,913,693; Toronto & Niagara P. C., $989,797.

Montreal Data.

In Montreal the public companies and the assessed values are shown as follows:

Montreal Tramways Co., $4,301,155; Grand Trunk Ry., $6,994,100; C.P.R. and Ont. & Quebec Rys., $12,388,855; Canadian Northern, $522,400; Lachine, Jacques Cartier & M. Ry., $103,900; Light Heat & Power Co., $3,757,750; Canadian Light & P. Co., $172,400; Sagarguay Elec. Co., $107,300; Shawinigan Water & Power Co., $42,500; Montreal Water & Power Co., $1,689,800; Bell Telephone Co., $2,256,650.

It will be noted that, while there are fewer public utility companies in Montreal than in Toronto, the last assessments of most of them are far larger than is the case in the Queen City.

SHUMAN'S SUN-POWER ENGINE.

IN a previous issue, attention was drawn to a sun-power pumping plant installed in Egypt.

The principle of this invention of Mr. Shuman's latest system of power-production, says a writer in the Daily Telegraph, is simple, the heat of the sun being used to raise steam in a specially constructed boiler, which steam drives a low-pressure engine. There is a series of generators, each consisting of a flat sheet-iron box, 3 ft. square, with plates only ⅛ in. apart, and covered by two sheets of glass an inch apart. The boxes are massed together over a space of 5,000 square feet, and have a heat-collecting area of about 10,300 square feet. The boxes are placed on trestles, and can be set at angles to suit the sun, whilst mirrors are used to direct additional sunlight on to the boilers.

The steam pipes from the various boxes are connected together, so that they discharge into a large pipe, 8 in. diameter, which conveys the steam to the engine. The latter is a low-pressure machine, designed specially to reduce heat losses to a minimum. It is provided with a tubular surface type condenser, which type is essential, as only distilled water can be used practically in the generators.

BLUE-BLACK FINISH.

TO obtain a blue-black finish on small steel parts, use a mixture of 16 parts by weight of saltpeter, and 2 parts black oxide of manganese. This is heated to a temperature of 750 degrees F., and the objects are immersed in it. The finish is "built on" to the metal, so that if the work is round, for example, the diameter is slightly increased. The oxide of manganese is deposited on the work and must, therefore, be frequently replenished in the mixture.

SPANISH RIVER PULP AND PAPER CO.

IN a memorandum issued showing the general position of the Spanish River Co.after the absorption of the Lake Superior Co., it is stated that the output from the three plants, as at present equipped, is approximately 140,000 tons of newsprint per annum. The various mills are now operating up to full capacity, which is as follows:—

	Tons Per day	Tons Per year
Espanola Mill	170	50,000
Sault Ste. Marie Mill..	230	70,000
Sturgeon Falls Mill ...	60	20,000
Total paper	460	140,000

On the question of earnings the memorandum says:

Part of the paper mill at Espanola commenced operations in June, 1912, and the remainder in July, 1913. The mills at Sturgeon Falls commenced operations in January, 1913. All the mills are on a proper operating basis as from July, 1913. The paper mill at Sault Ste. Marie is entirely new. The last of its four machines was not put in operation until April, 1913.

PAGE-HERSEY CO. AND SCOTT ACT.

Dear Sir,—In regard to the proposed Scott Act measure, we would like to put ourselves on record as being opposed to the Scott Act, and in favor of the strict enforcement of the present License Act.

We are of opinion that should the Scott Act be passed in Welland it would tend to keep skilled labor, for which there is always a demand, away from Welland, and make it hard for us to hold the men who are now here. In other words, the working men, who have no vote on the question, and who are greatly in the majority, will object to having their liberty taken away from them, and leave Welland, which would greatly hinder us in putting our product on the market.

In conclusion, we would say that we have not experienced any trouble through our men being intoxicated, and believe in letting well enough alone.

Yours truly,
Page-Hersey Iron Tube
and Lead Co., Ltd.
Per A. M. Mosley, manager.

SUPERHEATING STEAM.

IT is well known that steam can be superheated by the heat released during pressure reduction, but it is generally considered that such a method is extravagant, though interchange of heat in the same way occurs to some extent in ordinary working in consequence of wire drawing or throttling.

According to the Railway News, an arrangement including this feature has been designed for locomotive engines. Steam is superheated in passing through a valve placed in a casing alongside the steam dome, and in the path of the steam from the dome to the smoke-box, this valve being regulated to maintain a predetermined constant reduction of pressure. The valve comprises a series of pistons of graduated diameters and controlled by an adjustable spring. After passing this valve, the steam enters a smoke-box superheater consisting of a series of tubes connecting with side headers, from which it may be assumed that the superheat obtained by pressure reduction is not a very valuable factor taken by itself.

To assist the smoke-box superheater, small tubes are placed in some of the boiler tubes, so as to conduct some of the furnace gases directly to a casing surrounding the superheater.

Economies in the Installation of Electric Power

By W. E. Milne

The question of the most suitable power with which to operate our factories and workshops is one of large interest to those responsible for their management and in no less degree, does it concern the power plant operator. Expressions of opinion from those particularly interested in any phase of the subject are therefore necessarily instructive and valuable.

THE author acknowledged at the outset that the electric motor is not suitable for every class of work. There were, indeed, many instances in which its use might be advisable from an engineering point of view, but wherein it could not prove a commercial success. Technical knowledge and practical experience were essential to determine these cases. He was strongly of opinion that the commercial canvasser who, lacking any technical knowledge, possesses those qualities of salesmanship which enable him to get motors into consumer's premises, is a dangerous person to employ. Such a person, he said, is not able to discriminate between those jobs which are suitable and those which are ill adapted for the electric drive. Again, a number of the installations secured by him, even if not altogether unsatisfactory, are to a great extent spoilt through lack of engineering arrangement.

Technical Advice Necessary.

The author strongly emphasised the importance of technical advice in arranging an electric drive. He said that electric motors are too often installed on the advice of commercial assistants, or others possessing little or no electrical knowledge, and the results are lamentable, a shunt motor being recommended in all circumstances and for all purposes.

Considering the many types of electric motors and the great variety of control gear, he said, it is a pity that the shunt motor with an ordinary starting switch is apparently used on every possible occasion. A commercial engineer with technical knowledge should find no difficulty in inducing a reasonably-minded consumer to obtain, at slightly greater expense the type of motor or control gear which will give the maximum efficiency and the greatest convenience, and which will not only cover his requirements, but will also give many advantages not found in the usual installation.

Technical knowledge is also essential in handling alternating-current work. Unfortunately, in many cases, the engineers handling power installations display a lack of knowledge of the various forms of electrical apparatus which may be brought to the notice of manufacturers. The blame for the majority of unsuccessful installations of electric power should, however, rest on the shoulders of mechanical engineers rather than on electrical engineers.

The author thought that in considering the matter of economies, far too much importance is generally attached by power users to the actual cost of power, and it was also difficult to get a manufacturer to realise the many considerations which are put forward when comparing estimates for the cost of driving.

We are all familiar, he said, with the gas engineer's somewhat crude method of comparison between gas and electric driving. The power user is usually told that, say, a 10-h.p. gas engine takes 20 cubic feet of gas per horse-power-hour. On a 50-hours per week basis this works out at 10,000 cub. ft. of gas, which if charged at 36 cents per 1,000 cub. ft., equals $3.60. On the other hand, the customer is told that a 10-h.p. motor consumes approximately one unit per horse-power-hour, which is equivalent to 500 units per week. Taking current at 2 cents per unit, he is thus shown that the electric motor would cost $10 against $3.60 for a gas engine.

Having commented upon the unreliability of such comparisons, the author suggested that a method of estimating the cost of driving based on figures actually obtained from existing manufacturers' installations gives a common-sense and accurate comparison. Such a method, he contended, is practical, and the figures can be backed by the evidence and results obtained from several years' working on various drives.

Load Curve Comparison.

Another method of comparison which appeals to a manufacturer with an elementary knowledge of engineering, is to obtain load curves for the steam engines by means of continuous recorders, or from electric motors by means of recording ammeters, and to submit such curves to a power user.

The owner of a mill, which was steam driven, assured the author that the large number of rolls on his engine resulted in a practically steady load, so that the engine was worked at a very high efficiency throughout its run. He argued that under such conditions electricity could not compete with steam engines on the ground of cost. A continuous indicating diagram, however, showed that his load varied from 70 to 215 h.p., and a glance at the curve on the diagram secured, would convince any engineer that on such a load, the maximum efficiency cannot be obtained by steam driving.

Electrical Factory Labor.

In the concluding portion of his paper, the author presented an argument which he said unfortunately was not generally accorded the consideration it merited. This was that the conditions of labor and employment in electrically equipped factories are usually far superior to those found in works utilising any other form of power.

"It has been considered necessary for the well-being of labor," said Mr. Milne, "to enforce certain laws governing the lighting, ventilation, heating, and cleanliness of workshops and factories. It is safe to say that if electric power were universally used, and if no steam or gas were found in factories, these laws would rarely have been necessary. Practically in no case is steam or gas called in to improve the lighting, cleanliness, or ventilation of works. The introduction of electric power invariably gives better working conditions, and although these arguments may be somewhat advanced, there is no doubt they should be taken into consideration when considering the equipment of works and factories."

From a paper read before the Birmingham local section of the Institution of Electrical Engineers.

THE UNION OF GERMAN MACHINE-TOOL MANUFACTURERS.

AT a recent meeting of the Union of German Machine-Tool Manufacturers in Berlin, says Engineering, a report was read dealing with the state of the machine tool industry. According to this report, the position of the trade, which had shown some slight improvement in 1910 and 1911, had continued to develop satisfactorily during 1912. This was made manifest both in an increase in the number of hands employed and in a pronounced expansion in the export trade. The position in the machine-tool industry was thus in keeping with the tendency of trade in general.

The effect of the increased demand, and of the wars of last year had, however, caused a rapid rise in the price of raw materials, of wages, and of general costs of every description. Prices obtainable in the machine-tool industry were still depressed, notwithstanding numerous orders, and only in some branches had it been possible, by means of combines, to secure prices corresponding to the enhanced cost of production.

Added to this, the unsettled political conditions had resulted in orders being withheld, so that the trade with difficulty secured orders on a scale corresponding to its increased capacity. Even if the orders at present in hand were considered to be sufficient, the business situation could not become thoroughly satisfactory and sound until the political outlook had cleared, and the difficulty of shortness of money, which greatly impeded the industry, had been got over.

Attention was drawn to the fact that the competition between the machine-tool manufacturers not only resulted in lowering prices, but also had an unfavorable effect upon the manner in which payments were made. Reports from the different branches bore out this assertion. With the increase in the turnover, prices were shown to have fallen.

Increased Activity Feature.

The general increased activity was, in the first instance, due to the growing home demand, although exports had also increased satisfactorily. It was a notable circumstance that, in the case of machines which were manufactured in large quantities, the manufacture of which necessitated no special experience, export prices were slightly above those of the home market. For special tools, German makers were able to obtain very good prices in foreign markets.

When statistics were looked into, it appeared, as had been shown to be the case before, that the benefit of improving trade affected the German machine-tool industry much later and to a much smaller extent than it did other industries. One of the chief reasons for the disproportion between the satisfactory employment returns, and the unsatisfactory prices obtained, was to be found in the fact that numerous machine manufacturers, owing to inadequate methods of fixing costs and to erratic calculations, submitted tenders at figures which were much too low, and allowed them to be reduced to a level of prices which excluded all profit. It was, therefore, again necessary to lay stress upon the need of better arrangements for costing and estimating.

The terms of payment which the customers had forced upon the machine-tool manufacturers had simply resulted in the buyers being enabled to extend their works at the expense of the machine manufacturers, payments being made only out of the increased subsequent profits, and taking place therefore long after delivery. The same practice seemed to be finding its way into the foreign trade. The custom of insisting upon alterations in constructive details without additional remuneration was having a bad effect. The competition which existed was also used by the buyers as a lever for obtaining more stringent conditions of delivery and compensation. This was the case with orders both from the State and municipalities, as well as private buyers, who all tried to tie the manufacturer down in every way. In order to check this tendency, the Union strongly impressed upon its members the necessity of abiding by the delivery conditions framed by the Union, which do full justice to the buyer.

CASTING COPPER.

As is well known, it has been found practically impossible to cast copper which is mechanically sound and of high electrical conductivity, on account of the porous metal that is obtained. By an addition of boron, according to the author of a paper read recently before the American Institute of Metals, this can be accomplished. Boron has a high affinity for oxygen, nitrogen, and oxygen-containing gases, which cause the difficulty in copper casting. On the other hand, boron has no affinity for copper, and is therefore a good deoxidiser for the metal. One per cent. of boron suboxide flux—equivalent to 0.08 to 0.1 per cent. of boron suboxide—is added to the copper, and a casting that is commercially sound is obtained. Owing to this new development, the author states, cast copper is rapidly replacing forged copper in many electrical applications. The advantages derived from the use of cast copper are the saving of cost and the elimination of a number of joints, which are always a source of loss in efficiency.

CANADIAN MAGNETIC IRON SANDS.

G. C. MACKENZIE, in a report issued by the Canadian Department of Mines, gives an account of his investigation of the magnetic iron sands of Natashkwan, Que., of which there are deposits at various points along the north shore of the lower St. Lawrence River and Gulf. In their native condition they are unfit for the production of iron, and can be made so only by concentration.

The best means of accomplishing this has been demonstrated to be the wet magnetic separator of the Grondal type. Crude sand containing 14.7 per cent. iron and 4.43 per cent. titanic acid can be concentrated to a product containing 70.4 per cent. iron and 1.7 per cent. titanic acid, recovering, however, only about 45 per cent. of the original iron. Better adjustment of the separators and closer attention to details are thought likely to improve these figures. Details are given of a plant and process suitable for carrying out the process on a paying basis.

TESTING HARDNESS.

A new device for testing the hardness of steel by impact has recently been invented. A tubular standard, fitted with a hardened steel ball at the lower end, is placed on the steel to be tested. There is a spirit level at the upper end of the standard by which the latter can be brought to a true vertical position. Mounted on the standard is a cylindrical drop weight. By raising this to the top and dropping it, thereby, striking a weight-receiving block at the bottom of the standard, an impact is communicated to the steel ball which makes an indentation in the steel to be tested, similar to that produced by hydraulic pressure with the Brinell machine. The hardness of the steel is determined by measuring the diameter of the indentation with a celluloid scale.

DOMINION STEEL CORPORATION.

THE first quarterly statement to June 30, of the Dominion Steel Corporation under the new order as promised by President Plummer at the last meeting was issued on August 5, and shows earnings of 1½ per cent. on the common stock.

The total earnings available for dividends are given as $705,262.86. From the foregoing amount there falls to be deducted the dividend on preferred stock of the Corporation and constituent Companies, amounting to $245,000. This leaves $460,262.86, from which was taken the common stock dividend of 1 per cent. totalling $318,977, leaving a surplus of $141,285.86. Past experiences indicate that the quarter ending June 30 is the second poorest of the year.

July, it is said, was one of the best months the Corporation has ever passed, the gain in shipments being likely to reach 40 per cent. All departments, excepting the steel rod mill, are expected to show gains.

* * *

Fort William, Ont.—M. H. Braden has been awarded the contract for the construction of Fort William's new incinerator at a cost of $12,990, and the John Inglis Co., of Toronto, secured the contract for supplying the steel at $3.-350.

Victoria, B.C.—The city has awarded the following contracts for supplies: Mussens, Ltd., for dump cars; the Canadian Fairbanks-Morse Co., ventilating fans; the Hinton Electric Co., two 2 h.p. motors; A. F. Nye, two hoisting outfits; Mussens, Ltd., two drills; the Holden Co., one giant rock drill.

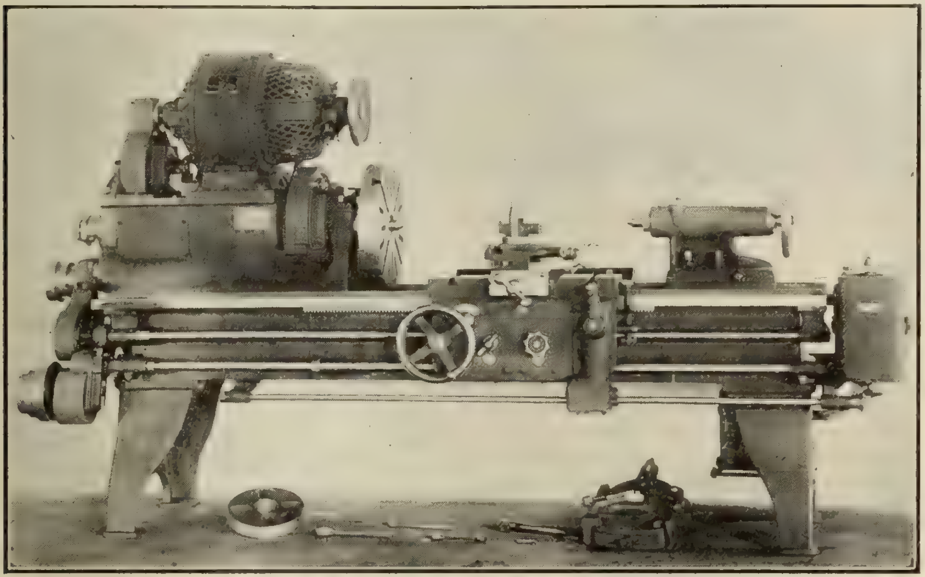
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

MOTOR-DRIVEN HEAVY DUTY LATHES.

THE motor-driven lathes here shown, which are products of the Reed Prentice Co., Worcester, Mass., are specially designed and built to withstand the strain of constant heavy turning, and are adapted for railroad and all kinds of heavy work. The machines are equipped with quick-change gear boxes, which are very easily operated, giving on the 18-inch machine 60 changes, and on the 27-inch machine 54 changes to both lead screw and feed rod.

There are three reductions of motor speeds by gearing and ten changes in controller, giving in all 30 spindle speeds. The fastest and slowest spindle speeds on the 18-inch lathe are 360 and 15 revolutions, respectively, while those obtained on the 27-inch machine are 172 and 5½ revolutions. The headstocks, as may be seen, are of massive proportions. The apron feed works are driven by worm and gears, and there are double frictions for lengthwise and cross-feeds. The lead screw is equipped with thread-cutting index.



MOTOR DRIVEN HEAVY DUTY LATHE.

The machines are driven by Westinghouse motors, semi-enclosed, 5 and 11½ h.p. for the 18 and 27-inch types, respectively. The hand wheels shown on the end of the motor shafts are used to turn the face plates in chucking the work to be machined.

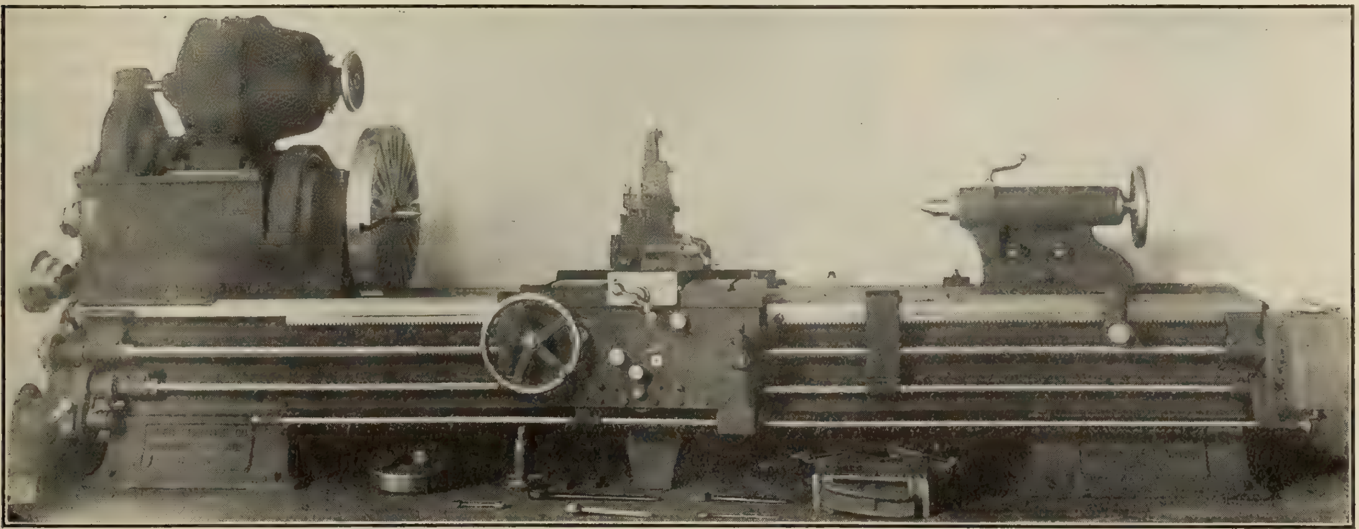
◆

MICARTA

A REMARKABLE new material, known as Micarta, which is claimed to take the place of hard fibre, glass porcelain, hard rubber, built-up mica, pressboard, rawhide, moulded compounds, etc., has been developed by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. It is used for commutator bushings and brush-holder insulation, as noiseless gear blanks, as conduit for automobile wiring, as spools for spark coil and magnet windings, for refillable fuse tubes, for wireless coil separators, for arc shields in circuit-breakers, for water-meter discs, etc.

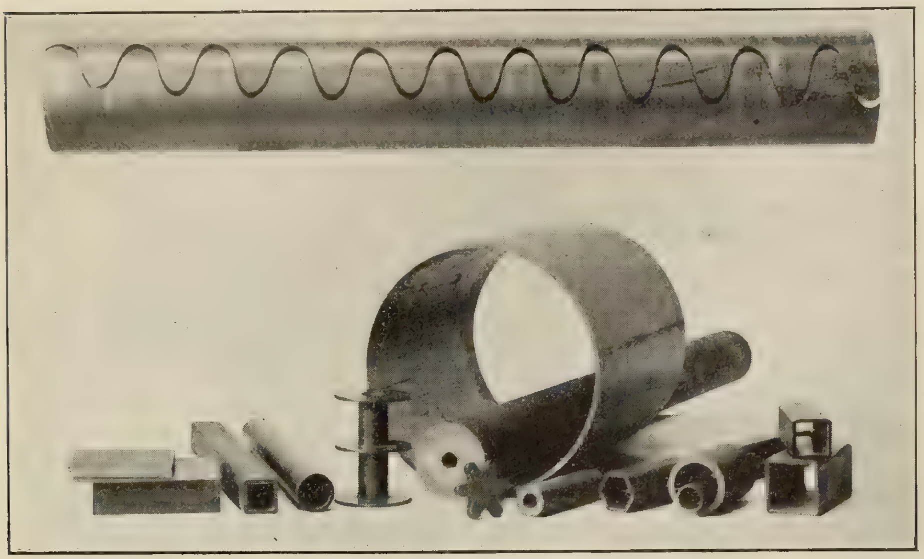
Micarta is a tan-brown colored, hard, homogeneous material having a mechanical strength about 50 per cent. greater than hard fibre. It can readily be sawn, milled, turned, tapped, threaded, etc., if a sharp pointed tool be used, and if the work be done on a lathe. Micarta is not brittle and will not warp, expand or shrink with age or exposure to the weather, but takes a high polish, presenting a finished appearance.

Two grades of the material are made. The grade known as Bakelite Micarta will stand a temperature of 150 degrees C. continuously, or 260 degrees C. for a short time. It is infusible, and will remain unaffected by heat until a temperature sufficient to carbonize it is



MOTOR DRIVEN HEAVY DUTY LATHE.

reached. Heat will not warp Bakelite Micarta, and it will stand an electric arc better than hard fibre, hard rubber, built-up mica, or any moulded insulation containing fibrous or resinous materials. Its coefficient of expansion is low, being approximately .00002 per degree C.



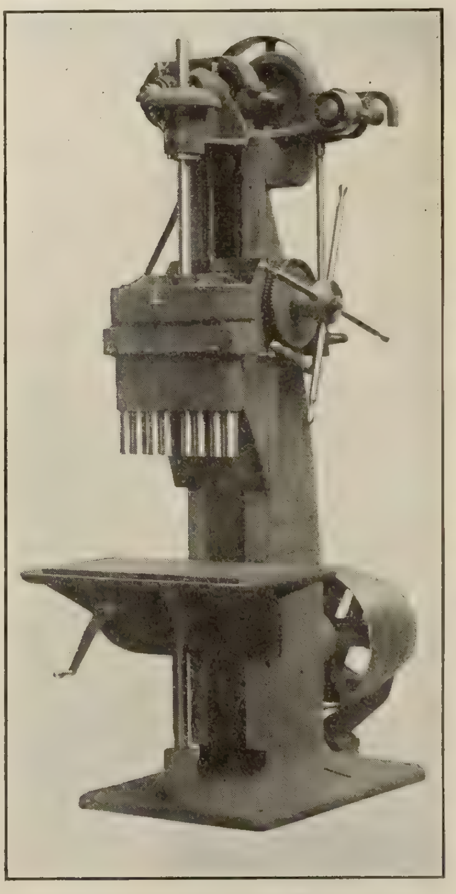
NATURAL BREAK IN BAKELITE MICARTA TUBING.
SAMPLES OF MICARTA PARTS.

Bakelite Micarta is insoluble in practically all of the ordinary solvents such as alcohol, benzine, turpentine and weak solutions of acids and alkalis, hot water and oils. It is indifferent to ozone—an advantage over hard rubber, resins, etc., for electrical purposes. It is non-hydroscopic and impervious to moisture. The other grade designated as No. 53 Micarta has the same mechanical and electrical properties as the Bakelite Micarta, but differs in its chemical and thermal properties. The plain Micarta behaves toward chemicals and heat very much as an ordinary resin. This grade is not used in plate form.

As proof of the uniformity of structure of Bakelite Micarta, the accompanying illustration of a fracture is shown. This is not a saw cut, but a natural break. The tube was held tight on a metal mandrel and a compressive force was applied at one end. When the force became sufficiently great the tube split as shown. The uniformity of the wavy fracture shows how homogeneous the material is. Such a break is known as a "harmonic fracture." It will be seen from the illustration, made from an actual photograph, that the strain followed the true harmonic wave almost as closely as the eye can detect, indicating that every part of the material was exactly as strong as every other part.

MULTIPLE SPINDLE DRILL.

THE 8 spindle fixed centre drill illustrated herewith has been brought out by the Foote-Burt Co., Cleveland, Ohio, and is one type of their No. 15½ multiple spindle drills. This machine is built with any number of spindles, and the spindles can be arranged either universally adjustable, adjustable in a straight line only, or fixed centre as per the illustration. It has been designed for handling automobile work, and is being used extensively on the valve hole work on automobile cylinder castings. It is also used for drilling the sides of the crank case, and for drilling some of the sides of the cylinders, or other multiple work required. It is used more extensively on the valve hole work for boring the large valve port hole, also for machining the valve seat and drilling and reaming the valve stem guide hole.



8 SPINDLE FIXED CENTRE DRILL.

With this type of machine, either having the proper number of spindles, fixed centre, or adjustable in a straight line, a manufacturer is able to do the number of valve holes required on the cylinder as quickly as it would be possible to do one with a single spindle machine. Some people arrange these machines in batteries, according to the number of operations required, and then process the work through same, each machine doing one operation. However, the smaller manufacturer can run a number of cylinders or other parts through the machine for one operation, and then change the tools and run through for the next operation, which of course gives him manufacturing results.

The spindles have large bearings, bronze bushed, and are made of 3½ per cent. nickel steel, and the head slide on the column is extra long to insure rigidity. The driving bevel gears are made of high carbon drop forgings having planed teeth, hardened. The machine is arranged with friction throw-out back gears, a Johnson friction clutch being used. This arrangement is for taking care of the large range of sizes between the large valve hole and the valve stem guide hole on the valve hole work, and also adds to the power of the unit.

The machine is driven by three step cone pulley, 15 in., 17 in., and 19 in. x 4¼ in. face. Six changes of power feed are provided by means of two-step cone pulley and change feed gears. Automatic knockoff to power feed is also arranged with quick traverse by large pilot spider wheel. The column is extra heavy, of box section, well ribbed, and the table has large working surface, with oil groove entirely around same, and is raised and lowered by means of jack screw with spiral gearing.

HEAVY DUTY RADIAL DRILL.

THE Fosdick Machine Tool Co., Cincinnati, Ohio, are putting on the market a 3ft. heavy duty round column radial drill, being the first size of a complete line of this type machine which the firm are manufacturing.

The machine combines simplicity, accuracy and durability, and has ample power to handle high-speed drills in a most efficient manner. It is self-contained, requiring no special foundation or countershaft. A very complete metal speed and feed plate for high-speed work is attached.

The base is deep and well ribbed, and is provided with extra large T slots. An oil channel around the base drains into a large reservoir.

The column is of the double tubular type. The fixed inner column extends to the top, where a large ball bearing insures easy swinging of the arm. It is rigidly clamped by a malleable lever which travels with the column, and is adjustable. The clamping surface is extra large, and is provided with means for taking up the wear.

The arm is of pipe section, well ribbed, and has adjustment to prevent sagging, and to provide means for taking up wear. The elevating screw is suspended by a ball bearing, and the arm lowers at twice the elevating speed by a handle placed below for the convenience of the operator. Safety trips for both extremes are provided.

The head is easily moved along the arm by a ball bearing spiral gear. All gears are thoroughly encased, and three changes of speed (through hardened gears and clutches) are made with one lever in front of the head. The tapping reverse frictions are mounted on a sleeve, allowing no grit to be drawn into the mechanism which runs in oil. The adjustment for wear is made from the outside.

The spindle is of crucible steel, and takes the thrust on a special ball bearing. The direct reading depth gauge and automatic trip may be set to the exact depth in any position. A safety trip is at the extreme.

All changes are made with one handle, which has a direct reading index dial. The feed box is low on the head, giving support to both ends of the worm. The worm wheel runs in oil, and the feed pinion is hardened. An overtake clutch permits the hand feed to be fed ahead of the power feed.

The speed box is simple and positive throughout, and has direct reading index. The changes are made by a single lever, and shock is avoided by an overtake arrangement which keeps the machine running at a reduced speed. A latch pin secures the tumbler and prevents chattering on heavy work.

The lubrication system is very complete. Oil chambers, felt wipers or pipes, as the location requires, are provided, and the bearings are of special phosphor bronze.

The machine is so designed and constructed that a motor drive may be added at any time, without the necessity for a special base or speed box.

Constant speed, or 3.1 variable speed motors may be used. They are connected by rawhide gearing. The motor horsepower is from 3 to 5, the floor space occupied is 9 ft. by 7 ft. 6 in., and the net weight of the machine 4,200 pounds.

CANADA'S TRADE WITH UNITED KINGDOM.

THE accounts relating to the trade and navigation of the United Kingdom for the six months ending June 30, were recently made public and show the following facts regarding trade with Canada:

	1912.	1913.
Imports	$50,992,000	$53,215,000
Exports produce and mfd. goods.	50,338,000	58,414,000
Re-exports	8,576,000	9,001,000

Among the principal articles were the following:

Imports from Canada.

Imports from Canada in 1913: Wheat, $15,909,000; wheat meal and flour, $5,235,000; bacon and hams, $3,029,000; cheese, $3,044,000; canned salmon, $2,377,000; wood, sawn or split, planed or dressed, $4,453,000.

Exports to Canada.

Exports of United Kingdom produce and manufactures to Canada:—Iron and steel and manufactures thereof (so far as distinguished in the monthly accounts), $4,234,000; cotton piece goods, $5,310,000; woollen and worsted tissues (including carpets and carpet rugs), $8,560,000; apparel, $2,403,000.

Merchandise Values Imported and Exported.

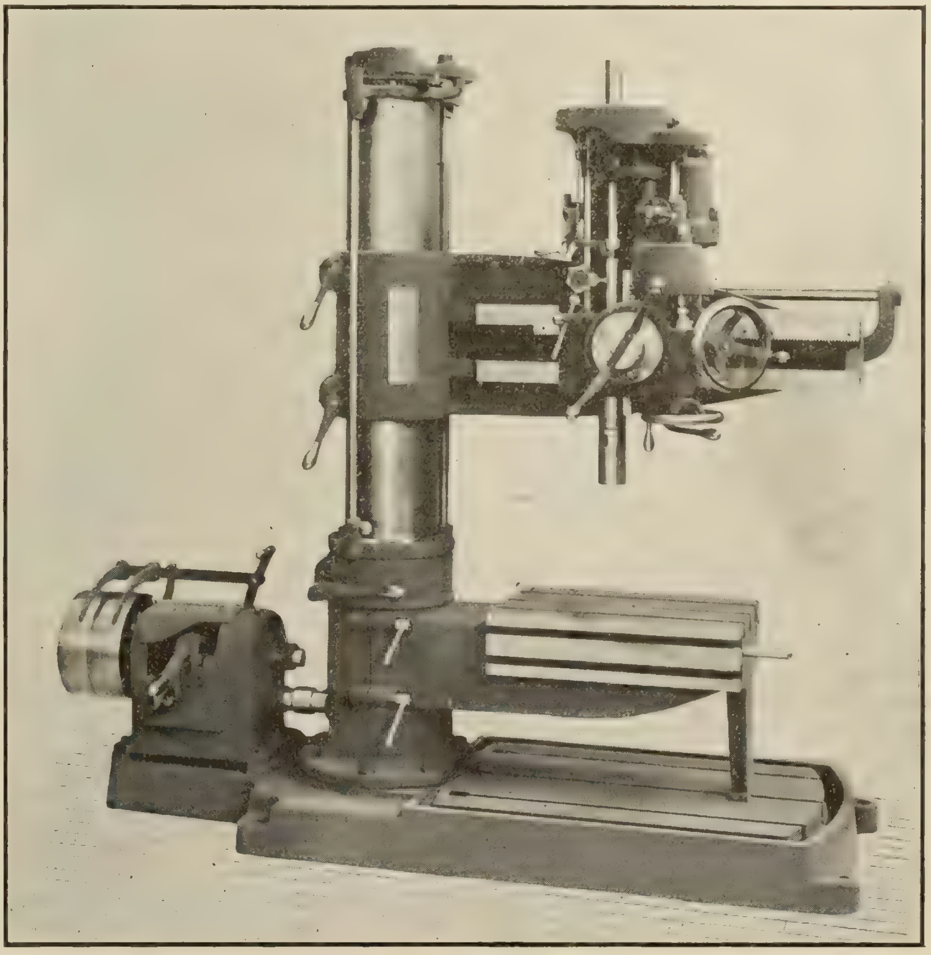
The total values of the merchandise imported into and exported from the United Kingdom from and to all countries during the half year were as follows:

Imports, $1,843,000,000; exports of United Kingdom produce and manufactures, $1,251,000,000; re-exports of foreign and colonial merchandise, $287,000,000. Compared with the figures for the first half of 1912—the highest previously recorded—these totals show the following increases:

Imports, nearly $121,000,000, or 7 per cent.; exports of United Kingdom produce and manufactures, $154,000,000, or 14 per cent.; re-exports of foreign and colonial merchandise, $6,000,000, or 2 per cent.

Food, Drink and Tobacco.

The increase of $121,000,000 in the value of imports includes increases of approximately $36,750,000 in “food, drink and tobacco; $42,000,000 in raw



HEAVY DUTY RADIAL DRILL.

materials and articles mainly unmanufactured,'' and $41,000,000 in ''articles wholly or mainly manufactured.''

Chief Export Increases.

The chief increases under the head of exports of United Kindom produce and manufactures are the following:—Coal, $39,600,000; iron and steel and manufactures thereof, $31,000,000; machinery, $13,300,000; new ships, $7,900,000; cotton piece goods, $26,700,000; chemicals, drugs, dyes and colors, $5,400,000.

A large part of the increase in the export of coal is, of course, due to the fact that from the end of February to the end of the first week in April of 1912 a great strike of coal miners was in operation. Even, however, as compared with 1911, the exports of coal show an increase of more than $32,000,000.

◆

RUSHING WORK ON HUDSON BAY RAILROAD.

THE expectation is now entertained that the Hudson Bay Railway will be completed by December, 1914. The work is being pushed ahead with vigor, and the development of terminal facilities at Port Nelson is being driven ahead so that the resources of the new port will assist materially in finishing the northern portions of the railway.

When the Hon. Frank Cochrane took charge of the Department of Railways and Canals, the first contract for the line had just been let. It was for 185½ miles, and called for an expenditure of three million dollars. Owing to the slowness with which the bridge company carried out its contract of bridging the river at Le Pas, there was a good deal of delay and it became necessary to extend the time from December 1, 1912, to December 1, 1913. The bridge, was completed in April last, and, since then, good progress has been made. On July 23, the contractors had reached Cormorant Lake narrows at mile 40, with the steel, and it is hoped to reach mile 60 by August 25. It looks as if 150 miles of grading will be completed this fall. There are 1,200 men on the work, and the only serious difficulty at present is the short supply of ties.

Just before the Minister set out on his journey over the route to Hudson Bay, he let the contract for the second section, 68 miles, from Thicket Portage to Split Lake Junction; the sum involved being $1,800,000. More recently the final section, 65 miles, has been let for $3,700,000. The time for the completion of these two latter sections is December 1, 1914.

The men working at the terminals now number 180, and it is expected that by the autumn 250 will be employed. Five steamers were chartered this summer to carry in supplies and the following plant has been purchased for delivery this season:—Sea-going tug, $43,250; steamboat Kathleen, $10,000; one steel tow barge and two steel sectional scows, $18,500; dredging machinery, $29,000. The Polson Iron Works, Toronto, have completed a large suction dredge and the same company is also at work on a $32,000 stern-wheel tug.

◆

THE WORLD'S COAL SUPPLY.

THE coal resources of the world are dealt with by the Geological Congress in three volumes of 1,360 pages in all, illustrated by upwards of 175 maps and figures, and accompanied by a 68-page atlas of geological colored maps. A digest of the work was last week read before the delegates in session.

The coal production of Canada at the present time is only in the neighborhood of twelve million tons annually, and though the output may be expected to increase rapidly, actual exhaustion of the supply lies very far in the future.

Total Reserve of Coal.

The total reserves of the world, compiled from all the reports received, amount to 7,397,533 million tons, of which nearly 4,000,000 millions are bituminous coals, nearly 3,000,000 millions are brown coals of various grades, and nearly 500,000 millions are anthracite coals. Of the anthracite coals, Asia, with the great Chinese fields, has by far the largest supply of any of the great continental divisions, furnishing 407,637 million tons; in bituminous coals, America with 271,080 million tons leads by a great margin, as she does also in the various grades of brown coals.

World's Production of Coal.

The world's production of coal for the year 1910 was about 1,145 million tons, so that, though much must be allowed for loss in mining and for areas that for various reasons cannot be economically mined, there still remains many hundreds of years before exhaustion of the supply may be looked for. Taking up the individual countries, however, it is found that in more than one case the end is in sight.

◆

WORKING HOURS AT C.P.R. ANGUS SHOPS.

THE reduction in the number of working hours and consequent loss of pay to the workmen in the locomotive department of the C.P.R. (Angus shops) which began on August 1st, has been somewhat modified by the company, and instead of being idle all day on Saturday, the men will work four and a half hours on that day each week. This will mean that instead of the hours being reduced from fifty to forty per week, which would have resulted in a loss of an average of $4.00 per man weekly, or a total of about $800, as it affects about two hundred men, the hours worked will now be forty-four and a half and the loss will average only about $2.20 per man.

While the men regret that in the summer months it has been found necessary to curtail the working days, yet they prefer this method to having any of their number discharged for want of work.

◆

DOMINION METALLURGICAL LABORATORY.

ANNOUNCEMENT is made concerning the installation at Ottawa of a modern metallurgical laboratory by the Mines Branch of the Canadian Department of Mines. It is to be devoted to concentration and metallurgical tests of Canadian ores and minerals, and will be operated free of all charges, including necessary assay. Reports of the tests are to be incorporated in the publications of the Department. Suitable crushing, screening, sampling, amalgamation and concentration apparatus are features. An experimental sintering and roasting plant is to be added.

◆

WELSH TIN PLATE IN CANADA.

WELSH tin plate manufacturers are making an effort to get back the Canadian tin plate trade, which has been largely taken by the United States in the past year. They have interviewed the Colonial Secretary and the President of the Board of Trade with a view to having them exert their influence in Canada. It is intimated in British journals that the Canadian customs officials have misread the tariff law, with the result that American tin plate manufacturers have profited at the expense of those in Wales. Representations have been made to various members of tthe Canadian Parliament, who have expressed themselves as being in favor of an alteration of the law. It is charged that American tin plates are sold in Canada at dumping prices, and the Welsh tin plate makers want the anti-dumping provision of the Canadian Tariff Act put in force.

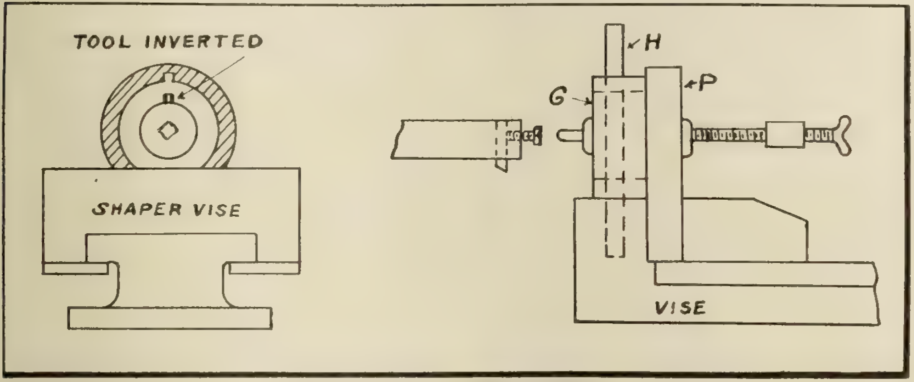
MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

KEYSEATING IN THE SHAPER.

By D. A. Hampson.

THE range of usefulness of the shaper as a keyseating tool may be widened by the two kinks shown in the illustration. Neither of them involves any expenditure for special fixtures or tools, although it is assumed that an extension for keyseating is a part of the shaper equipment, and that the "clapper" block can be bolted down so that it cannot lift on the return.



KEYSEATING IN THE SHAPER.

To cut a keyseat in a ring, collar, or gear the natural way is to turn the vise so that its opening is in line with the travel of the ram; however, pieces do show up which, because of lightness, extending hubs, and interfering parts, cannot be held in this manner, and the width of metal available for holding is not sufficient to permit the vise to be swivelled 90 deg. The ring shown in the first illustration is an example of such a case. By blocking the tool holder from lifting and pointing the cutting tool upwards, the keyseat may be cut with ease and ample gripping surface secured to preserve alignment and provide rigidity.

In the second figure is shown a kink for holding a lever arm, quadrant, or any similar piece having projecting parts that will not let it go down in the vise. Two parallels are clamped upright in the vise, a predetermined distance apart. Against them the work is held by two C-clamps. A shorter and stiffer tool may be used if these two methods are employed; no time is lost on an elaborate "set-up," and the vise is not removed from the machine. An awkward shaped casting can be set up in less than ten minutes by the second method—noting the piece in the figure, (G), is the casting held against parallel (P.) The quadrant (H) makes the piece slow to set up by ordinary methods.

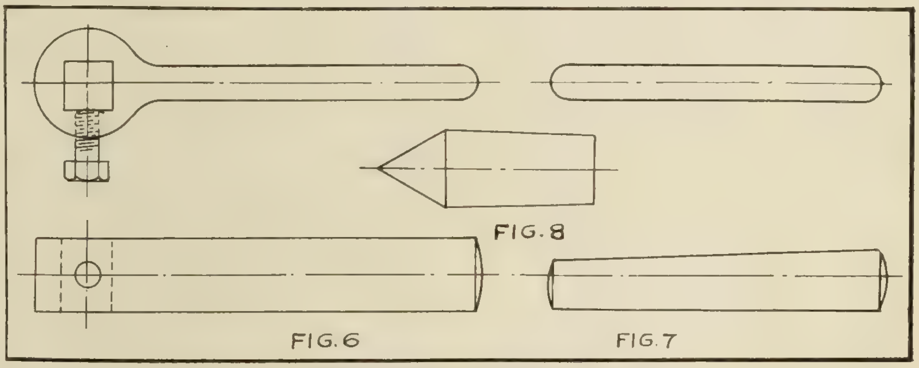
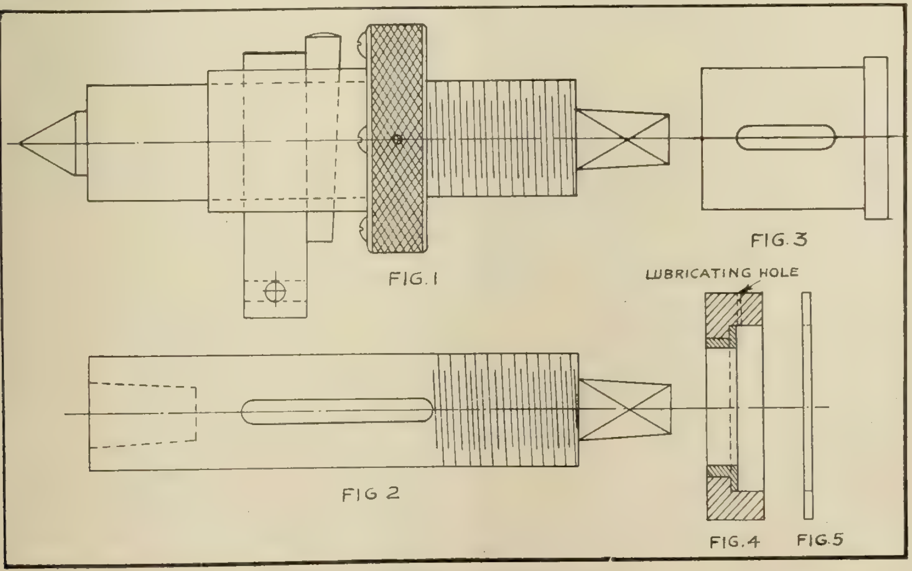
SELF-FEEDING CUTTER BAR.

By H. Womersley.

THIS is a very effective and efficient tool, there being lots of jobs on which the self-feed cutter bar can be used to advantage, such work as cutting large holes in boiler plates, bulkheads, etc. The bar can be used in a ratchet or air drilling machine. A general view of the bar is shown in Fig. 1, and detail parts are shown in Figs. 2 to 8.



SELF FEEDING CUTTER BAR.



SELF FEEDING CUTTER BAR

To Make Cutter Bar.

Having decided to use bar in the ratchet, cut off mild steel bar to length. Turn and put fine thread on bar; 15 threads per inch is a suitable pitch. Next bore out shaft end for cast steel centre. When putting in cotter slot, make the latter long enough, because the longer the cotter way, the greater the traverse.

Next make sleeve as shown in Fig. 3. Bore out to suit bar, then turn as shown. Cut out slots to take tool-holder and cotter. Make a nut as shown in Fig. 4, turn outer shell, then insert brass brush and threads to suit bar, also knurl outside of nut.

Fig. 5 is a collar, ⅛ inch thick, turned on outside diameter to the same size as nut, and bored out to fit easy on sleeve. It is fixed to nut with four ¼ in. screws as shown. Figs. 6 and 7 show tool holder and cotter, while Fig. 8 is the cast steel centre. Do not forget a lubricating hole in nut.

TRUCK STANDS FOR GEARS AND PULLEYS.

James E. Cooley.

PERHAPS no feature of machine-shop practice has been given so little attention as the method of piling up gear blanks and pulleys during machine operations. Common ways of keeping them together consist in piling them in heaps on the floor near the machine, or stacking them one on top of the other, and inserting a rod, pipe, or round stick through their hubs. In some instances, the rod or pipe is attached to a base, but, where no base is used, the rod or pipe must nearly fit the holes in the hubs of these stacks will topple over. Where the work is piled on the floor in heaps, considerable room is taken up, they are easily jammed or broken; besides, it requires the handling of each piece separately when removing to another machine or department. When a large number of these pieces have to be machined; the most reliable and inexpensive way of handling and keeping them together is by means of stands made from wrought-iron pipe screwed into a base for this purpose.

In the accompanying illustration are shown two designs of bases that when piped up will hold a large quantity of this class of work, as well as cams, flanges, and other special pieces. Fig. 1, is a base 8 inches diameter, into which can be screwed either a ⅜ inch or ½ inch wrought-iron pipe. This will hold the lighter class of work up to 8 inches diameter. The base in Fig. 2, having a ¾ inch or 1 inch pipe is stronger, and takes in work up to 12 inches diameter.

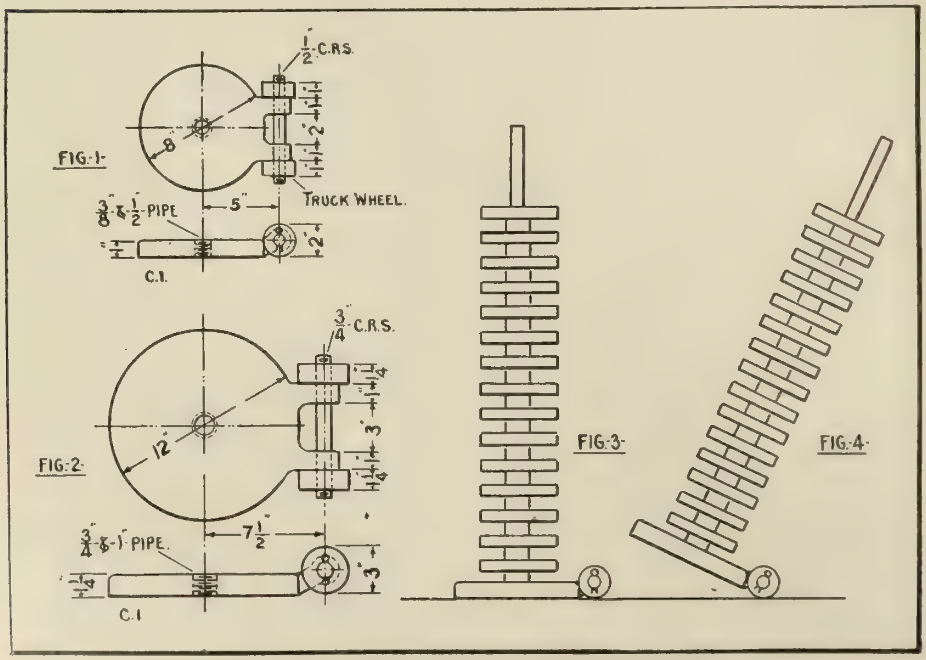
An improvement in trucking these stands from a lathe to a gear cutter or splining machine, etc., is shown by having truck wheels attached to the base. The usual method of moving these stands is by means of a two wheel truck. When the stand is carried in this way, it requires considerable care to keep the pieces on the truck, owing to their circular shape, and, as the truck moves, they roll and shake, and become jammed and nicked up on the iron-work of the truck.

In Fig. 3, is shown a stack of gear blanks ready to be moved. By taking hold of the end of the pipe for a handle, and tilting the stand back as in Fig. 4, it can be easily rolled along the floor to any required distance. These stands can be extensively employed in every machine shop, and should be made up several at a time. The dimensions are given for the bases, trucks, and shafts. The pipe used can be cut any convenient length up to 6 feet.

CONVENTION OF LOCOMOTIVE ENGINEERS.

THE International Brotherhood of Locomotive Engineers held their Annual Convention at Montreal during the week ending August 9. Convention headquarters were established at the Windsor Hotel, and there over 2,300 delegates and their wives registered during the week. In all there are some 80,000 members of the 900 lodges of engineers scattered throughout the western hemisphere, and, although this was the function of the Canadian branches, there were present a large number of members resident in the United States.

On Tuesday, August 5, the delegates were given a public reception, being welcomed on behalf of the Mayor and the civic authorities by Alderman Macdonald. In the evening a musical programme was carried out. The reception committee arranged an interesting series of sight-seeing trips in and around Montreal, and these alternated with the business sessions. The latter were not open to the public, but it is understood that some very interesting sessions were held, and that both from a business and social point of view the Convention was a great success.



TRUCK STANDS FOR GEARS AND PULLEYS.

WHAT IS AN ION?

SIR WILLIAM RAMSAY, writing in Harper's Magazine, says—For long, electricity was supposed to be a mysterious fluid, or rather, two mysterious fluids, one of which was called "positive," the other "negative." It has now been shown, thanks to the investigations of Sir J. J. Thomson, of Cambridge, that what was known as a current of "negative" electricity is, in actual fact, a stream of small particles moving with great velocity. These particles of electricity, known as electrons, can combine with matter. Metals are such compounds; and gases like oxygen and nitrogen have also electrons associated with them.

When an atom of oxygen, of iron, or indeed of any substance, has been deprived of an electron, or has had an electron added to it, it becomes an ion. If the electric particle has been removed, it is said to be a positive ion; if the electron has been added, it is called negative.

The word "ion" means "going" or "travelling." Such atoms are easily attracted to or repelled by electrified bodies, and they move rapidly toward them, or away from them, as the case may be. If the electrification of the body is negative—that is, if there be an excess of electrons adhering to its surface—it repels particles which have also an excess electron; if, on the contrary, the electrified body is electrified by having had electrons removed (and that is called positive electrification), then it will attract particles having an excess electron.

BLAST QUANTITY AND PRESSURE IN CUPOLA WORKING.*

By F. J. Cook.

THE writer has for many years had under consideration the action of blast furnace pressure, but for a very long time was unable to investigate the distinctive action of quantity apart from pressure, owing to the want of proper measuring apparatus. The advent of pneumatic tools, and the wider adoption of compressed air has, however, led to much thought and research on the measurement of the latter, and the results obtained by various investigators have been helpful in the design of an apparatus suitable for the experiments under consideration.

Flow of Air Measurement.

There are now many well-recognized methods of measuring the flow of air, the one used in this investigation being that by which the measurement is made by the change of pressure between the entrance and throat of a Venturi tube or convergent-divergent nozzle. It has the considerable advantage that the greater portion of the pressure drop which is utilized for measuring the velocity is recovered by the air before leaving the tube. For instance, with a pressure drop of 6 inches of water between the entrance and the throat of the Venturi tube, the drop between the entrance and the exit was only about 1 in. of water. In this case an error in reading the manometer gauge of 0.1 in. is only productive of an error less than 1 per cent. in the calculated volume of air passing.

It may be observed here that the common practice of measuring air by volume is evidently less desirable than that of measuring it by weight, since the amount of oxygen available for combustion of the coke and melting of metal in a cupola is directly proportional to the volume after suitable corrections for pressure and temperature have been applied, which corrections will vary from day to day, if not from hour to hour. For this reason, the measurements of quantity of air per minute have been considered in terms of weight throughout this paper.

Two cupolas of the dimensions given in Table 1 were available for experiments. It will be noticed that these not only vary in their diameters at the melting zone, but that the smaller one has a greater tuyere area than the larger, therefore, if formulae can be adduced to which these two very differently proportioned cupolas will conform, they may reasonably be considered correct for cupolas in general. Air was supplied by a Piftin type of rotary blower driven by a variable-speed electric motor. For outputs of air below that to be obtained with the lowest speed of motor, the blower intake was throttled.

TABLE I.—PARTICULARS OF CUPOLAS.

Cupola	B	A
Diam. at melting zone	2 ft. 3 in.	3 ft. 6 in.
Area of tuyeres in sq. ins.	94.4	91.2
$\frac{A\ Z}{A\ T}$	6	15
Height from top row of tuyeres to charging door sill	13 ft. 1 in.	13 ft. 4 in.
Number of tuyeres	8	7
Rows of tuyeres	2	2

AZ—Area across cupola at melting zone.
AT=Total area of tuyeres.

Maximum Output With Varying Blasts.

After some preliminary investigations, it was decided to ascertain the maximum output of molten iron that could be obtained with varying conditions of blast. The routine observed was to start up the cupolas in the ordinary way, and in half an hour or so after the blast had been put on—which was considered sufficient time to insure that the coke bed had reached the normal height—the blower was regulated to give the desired output of air, the cupola was emptied of all molten metal and the trial commenced. Every care was taken to insure comparative working; the metal was weighed to pounds, the coke measured, the stock kept up to the level of the cupola charging-door sill, and all tuyere sight-holes and slag-holes kept closed during the trials, which lasted from one-half hour to one hour each.

Readings of quantity and pressure of the blast were taken every 2½ minutes and the molten metal was measured in the same ladle for each test, and independently checked by three persons. The whole of the metal melted during each trial was kept in the ladle before pouring. The summary of the results are given in Table 2.

One of the outstanding features of these results is the regular working which ensued during each trial, the average of pressure multiplied by quantity practically equalling (and in some cases actually so) average pressure multiplied by average quantity. The output given is the maximum which can be obtained over a short period. Over a fair afternoon's blow, the large cupola gave within 10 per cent. of the maximum shown in Table 2, and the small one within 15 per cent.

Expert Opinions.

John Jermain Porter, formerly professor in the University of Cincinnati, in an article in the Engineering Magazine says: "The maximum output of a cupola was obtained with 25 to 30 lb. of air per sq. ft. area of melting zone." To this, the large cupola approximated; but although the figures stated give a margin of 20 per cent., it is obvious they will not apply in the case of the small cupola, seeing that the minimum air supplied was 43 and the maximum 57 lb. per sq. ft. area of melting zone.

Dr. R. Moldenke shows in a recent article that the melting zone in a cupola is probably around an inverted cone, with which the author agrees. The proportions of this cone will necessarily be dependent upon the penetrating influence and velocity of the blast due to its pressure as well as to the quantity of air. If, therefore, pressure and quantity are both dominating factors, any theory that leaves out one or the other is not based on sound principles.

Rate of Output Limited.

As may be expected, there is a limit to the rate of output of any cupola, and it is excessive oxidation which will in general set this limit. Again, a comparison of the dimensions and results obtained with the two cupolas shows that the maximum weights of iron per hour which could be melted were approximately proportional to the diameters of the melting zones. These conclusions may be combined into two quite simple laws as follows:

1.—That the output of any cupola up to its maximum value in tons per hour is equal to the product of the air supplied in pounds per minute multiplied by the square root of the pressure of the air in ounces and divided by 120.

2.—That the maximum possible rate of successful output will be obtained when the square root of the pressure of the blast in ounces multiplied by the quantity of blast in pounds per minute divided by diameter of melting zone in feet equals 330.

Effect of Blast.

In addition to the blast pressure, having an effect upon the melting ratio in a cupola, it also has a large bearing on the quality of the metal produced, as distinct from quantity. As pressure has been shown to be of much importance, it necessarily follows that the size of the tuyeres (on which pressure so largely depends) should receive careful consideration; and it is the author's opinion that where the castings are required to have the maximum softness, the total area of the tuyeres should not be over one-sixth the area of the melting zone.

---

*From a paper read at the recent British Foundrymen's Convention.

For general engineering work, which is usually much heavier than the former, and where iron closer in texture is desired, tthe tuyeres area should be about one-ninth the area of melting zone, and for steam and gas-engine cylinder and similar work, the total tuyere area should be from one-twelfth to one-sixteenth the area across the melting zone.

Height of Cupola.

The height of the cupola from the top of the tuyeres to the charging-door sill appears also to have a bearing on the efficiency of the cupola. The results of a great many particulars published in the technical press have shown that where this dimension has been not less than two and one-half to three times the diameter across the melting zone, the cupolas have given much better results than in cases where the dimension has been less.

Coke Quality and Quantity.

An item of very great importance in the economical working of a cupola is the quality and quantity of coke used. Probably John Jermain Porter has done more work on the thermo-efficiency of coke in the cupola than anyone else, and in the article previously referred to, he states that, with coke containing 90 per cent. of carbon, the consumption with well-designed and economically-worked cupolas should not exceed 0.09 lb. per lb. of metal melted. In the experiments under consideration, the average composition of the coke was 92 per cent. carbon, and the consumption was 0.075 lb. per lb. of iron melted.

Conclusions.

The author's opinions and experience, together with the results of the tests given, lead him to the following conclusions:

1.—That both pressure and quantity of blast have to be considered in cupola working.

2.—That an average of 120—in terms of quantity of air in pounds, multiplied by the square root of the pressure in ounces—is required to melt one ton of ordinary phosphoric iron.

3.—That the maximum output of metal melted per hour is more nearly comparative to diameters than areas of cupolas.

4.—That the maximum output of a cupola will be obtained when the pressure and quantity of the blast in ounces and pounds per minute respectively, are so adjusted that the quantity of blast in lbs. per minute, (W), multiplied by the square root of the pressure of the blast in ounces, (P), and divided by (D)=330; D being the diameter of the melting zone in feet.

4a.—That any further increase in the product (W), multiplied by the square root of (P), beyond that determined in conclusion (4), results in excessive oxidation of the metal in the cupola.

5.—That iron melted in a cupola is affected in hardness directly as the pressure of blast used.

6.—That in consequence of (5), the total area of the tuyeres employed should be regulated according to the class of iron being melted, small areas being used when greater hardness is required.

7.—That the height of the cupola, from the top tuyeres to the charging-door sill, should not be less than two and a half to three times the diameter across the melting zone.

8.—That the coke consumption in a well-designed cupola need not be more than 0.075 to 0.09 lb. per pound of ordinary phosphoric iron melted, when the coke contains from 90 to 92 per cent. of carbon.

TABLE II.—SUMMARY OF TESTS.

*Volume measured at pressure and temperature existing in the blast pipe.
P=Pressure of blast in ounces.
W=Lbs. of air per minute.

ALGOMA STEEL CO. BREAKING RECORDS.

IT is clear, says a press despatch, that all records previously made will be broken by the Algoma Steel Co. this year. Last month the record was broken, 29,300 tons of steel rails being rolled. In addition, on the last night of the month, the daily record was broken in the rail mill, and over 1,400 tons of rails were rolled for the twenty-four hours ended by that night. The total steel production by the company for the present year will in all probability be at least 25 per cent. greater than that of any previous year. In fact, on its earnings alone, the Algoma Steel Company will be in a position to materially assist the holding company in the payment of dividends this year.

The deal with the Spanish River Co. is also a great advantage to the Corporation, enabling them to compete in the American and general markets on much more favorable terms, as they will now be able to market much larger quantities of paper.

In the mines branch work is proceeding very favorably at the Magpie mine, about 1,000 tons per week being shipped to the "Soo," where the ore is much liked by the open hearth department. Of course, about five-sixths of the ore used by the plant is imported from the Mesabi, but with the construction of the new plant, which is planned to double the present capacity of the steel works, and the installation of a battery of at least ten open-hearth furnaces, the demand for Magpie ore will be greatly increased.

In addition, the Helen mine is being reopened, and it is probable that furnaces will be installed to roast the ore from the new ore body, which is Siderite. The addition of the new open-hearth furnaces will take care of any ore produced by this property.

Railway construction on the Algoma Central, and also the Algoma Eastern Railway is proceeding very satisfactorily. On the Algoma Central the line is graded well beyond Franz, and it is expected that the whole line to the National Transcontinental Railroad will be practically completed by the winter. Altogether, the entire plant is giving evidence of decided success and efficient management.

CANADA'S TRADE WITH NEW ZEALAND.

WHILE Canada's trade with New Zealand is steadily increasing, according to the reports of Trade Commissioner Beddoe, the percentage of the New Zealand trade is less than that of many countries which have no preferential treatment. For the fiscal year ending March, imports from Great Britain were 59.2 per cent. of the total; from Australia, 12.9 per cent.; from the United States, 9.8 per cent.; from Germany, 3.1 per cent.; and from Canada, 1.8 per cent.

New Zealand extends preferential tariff treatment to Canada over a certain list of articles, and, in the fiscal year 1913, it worked out thus: Imports from Canada under the preference were valued at $968,450, and imports in respect of which there was no preference were valued at $1,070,760.

Exports from New Zealand to Canada for the fiscal year were valued at $2,943,505, and for the eleven months ending February, 1913, New Zealand sent $1,334,270 worth of butter to Canada under the preferential tariff.

TRAFFIC OF PORT OF MONTREAL.

THE revenue from the traffic of the port of Montreal for July increased in every department except exports, which were stationary in volume, as compared with the corresponding period of last year. Receipts from local traffic showed a phenomenal increase, over 50 per cent. more than for July, 1912.

The collector of customs reported receipts from imports of $42,000, as against $38,000 for July last year; from exports, $17,000, the precise amount which was collected for July, 1912; total, $59,000, as compared with $55,000. The wharfinger for local traffic reported receipts of $18,072.69, compared with $12,530.74 for July, 1912.

Adding the amounts previously reported since the opening of navigation, there is a total for this year of $214,918.05, as compared with $191,729.16 for last year to July 31 inclusive, an increase of $23,188.89. This increase is made up from increased imports, $13,500; exports, $3,500, and local traffic, $6,188.89.

EXTENSIONS AT THE MONTREAL LOCOMOTIVE WORKS.

WITH a view to increasing the output of their Longue Pointe shops, the Montreal Locomotive Works, Ltd., are at present engaged in making extensive additions to their plant and equipment. The machine shop is being extended 220 ft. by 132 ft., and when this is completed the present machines will be largely rearranged and a considerable amount of new machinery installed.

A new grey iron foundry is also being built. This measures 220 ft. by 330 ft., and will consist of three bays. The coke, pig, etc., will be stored under cover in a high bay adjacent to the east side of the foundry, and this bay will be served by an overhead traveller, which will raise the charges in skips and deliver them direct to the charging platform. The charges will be weighed directly in the skip by means of a portable multiple beam scale suspended from the crane hook.

A running shed, 75 ft. by 120 ft., is also being built, and will be served by a 10-ton traveller. This shed will give great relief to the erecting shop, for, as soon as the heavy erecting work and the wheeling is finished, the engine will be moved to the running shed, and the lighter work completed under the 10-ton crane.

The improvements on hand will involve an expenditure of $600,000, and are expected to increase the output by more than one-third.

During the year ending June 30 the Montreal Locomotive Works turned out 300 locomotives, and when the full benefit of the new additions is felt, this capacity will be increased to over 400 heavy engines per annum.

SMELTING ORE IN SWEDEN.

ELECTRIC iron ore smelting is making comparatively rapid progress in Sweden, several installations already being in operation, and the erection of others is under contemplation. At the Stord Kopparbergs Bergslags Co., electric iron ore smelting has been going on for some time, both in the furnace started in 1911, and in a 6,000 horse-power furnace completed in the course of last year; in the latter ferro-silicon is being produced.

An electric pig iron furnace of the Helfonstein type, owing to certain circumstances, was not completed during 1912, but is now likely to be started soon. A series of experimental smeltings have been going on, in a smaller and older electric furnace, so as to ascertain the suitability of charges of different kinds of iron for electric smelting.

At Kirunavaara, the erection of some electric iron ore smelting furnaces has been proposed by the well known expert, Mr. A. Gronvall, the managing director of the Elektrometal Co., who has applied to the Government for a concession to reduce electrically the so-called (A) ore at the place where it is being broken. The following conditions are laid down in the application:

1.—The right to break and utilize, in the manner mentioned, up to 50,000 tons of ore, principally (A) ore, per annum for a period of not less than forty years, on deposits belonging to the State and subject to a royalty to the State of 1 kr. per ton of the ore used for the said purpose.

2.—The granting of 30 per cent. allowance on the current rates of freight for the transport of ore, coal, and pig iron on the Lulea-Riksgrausen Railway.

3.—The right of use of the necessary area on land belonging to the State in the vicinity of Kiruna Railway Station.

The plan comprises the building of two electric furnaces, each of 4,000 horse-power capacity, which will entail an expenditure of 1,000,000 kr ($275,000), in addition to which some 500,000 kr. will be wanted for working capital.

A staff of some fifty men will be required, and the value of the annual turnover is calculated at about 2,000,000 kr. The installation is expected to be ready in the beginning of 1915, at the same time that electric energy from the State hydro-electric power station at Porjus should be available.

* * *

A sheet steel belt, 4 inches wide, is used in the works of Benz & Co., builders of automobile and crude oil engines, at Mannheim, Germany, in place of a 16-in. double leather belt.

THE STUDY SEASON LOOMING UP.

EVIDENCES are not wanting that the "good old summer time" is becoming spent, and that its once myriad invitations and opportunities for play, at least in our hours of leisure, are dwindling percepibly in number perceptibly in number

The educational side of our nature makes a strong appeal for consideration about this time, and the different technical organizations and institutions which cater to this feature begin to lay their plans to meet the need. Incidentally, a too large percentage of mechanics are quite deficient in the most elementary principles and application of an education based on reading, writing, arithmetic, grammar and composition; this we consider a great handicap to the propagation and development of the technical feature. Operative readers should set themselves a course of study in those directions in which they feel themselves most lacking, care being taken, of course, that the achievement set be not so exacting as to become a burden.

TRADE PAPER EDITORIAL CODE.

THE precepts herewith were first given expression to by their author, J. George Frederick, in a speech delivered before the Grocery Trade Press Convention, and were read later before the Allied Trade Press.

The co-operative efforts of those responsible for Canadian Machinery publication are, needless to say, shaped in conformity with the ideals herein set forth, and the measure of success in compassing these, has been such as to merit the commendation of advertisers, non-advertisers, and subscribers alike.

Never discriminate in editorial columns between advertisers and non-advertisers; either by what you say or what you do not say, or by the way you say things.

Never, even in the sublest way, turn the weight of your influence against your readers' interests—either by printing certain articles or editorials, or by failing to print them, or by minimizing and discrediting.

Never print a single word or line furnished by an advertiser which you wouldn't publish if it came in through the regular editorial channels.

Accept no advertising contingent upon the publication of any editorial matter.

Have no favorites in the field among advertisers, whether that favoritism is conscious or unconscious.

Never worry about an advertiser's kick about your editorial policy, if that policy is wholesome, constructive and in your readers' best interests.

Treat personal items about advertisers, and individuals connected with them, exactly as you treat others, for be sure that personal favoritism or personal knocking is quickly sensed and judged by readers, no matter how subtly done.

Give your properly appointed editors a thorough education in the practical but high-minded ethics of editing, and then let them be the final judges of editorial questions which arise in relation to advertisers or advertising.

Standardize your advertising solicitors' replies to all efforts of advertisers or others to use influence editorially: "Our editors must be the judges of such matters; get in touch with them; they will be glad to consider any suggestion. I am authorized to talk only about advertising."

Keep editorial department in practical touch with advertising department, but simply to study the pulse of the field as evidenced by the activity in its "selling end" (the advertisers), so as to turn around and the more accurately and completely serve the "buying end" (the subscribers).

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, August 11, 1913.—Conditions generally remain unchanged from last week. Machinery dealers report that trade is as good as can be expected under present financial conditions, and that is the best that can be said. Tenders have been submitted on part of the equipment for the plant which is to be erected for Armstrong , Whitworth & Co., at Longueuil, but it will probably be some considerable time before a decision is reached in this matter.

Metals.

Pig iron shows a firmer tendency this week though no very large sales are reported. The slight rise in price is largely due to the difficulty United States furnaces are now experiencing in obtaining regular supplies of Lake Superior ore owing to the strike in that district. They have had to advance their prices, thus enabling Canadian producers to do the same. Copper continues firm, and both lead and tin are improving. The present low price of old metals hardly reflects the true state of that market, for the demand is fairly brisk, but the price is being kept down by the existing money stringency. In an effort to raise some ready money, many large wholesale hardware houses, machinery dealers, etc., are selling off old stock for scrap. For this scrap, the old metal dealers can only afford to give a low price, because the majority of their large customers are now taking 40 to 45 days to settle accounts which are customarily paid in 30 days. On the whole, trade in Montreal is fairly good, even if it is not showing any great increase in volume just now. The general feeling with regard to the future is one of confidence, and orders are about as good as they were at this period last year

Toronto, August 12.—While the condition of the steel and iron market is improved, the market for both contractors' supplies and machine shop equipment still keeps quiet. The A. R. Williams Co., Toronto, are busy removing their stock across the road, on Front Street, and in a week's time, the G.T.R. will begin the demolition of the vacated premises.

Pig Iron, Etc.

Inquiries for pig iron have been coming in quite freely during the past week, especially from stove manufacturers who, apparently, are preparing for good business this fall. Prices remain firm at the mills, and no inducements are being given to manufacturers to place orders. The representative of a big Canadian steel firm ventures the prediction to-day that sixty days would see a decided improvement in the steel and iron business, and a loosening up of money. Holidays just now seem to have a deleterious effect on business generally. The Steel Co. of Canada report inquiries good, that bars especially are keeping up well, and that prospects are rosy. Canada Steel Co. new rod mill at Hamilton was partly destroyed by fire last night, the damage amounting to $20,000. Besides the mill, much damage was done to the machine shop and blacksmith's shop.

Miscellaneous.

The price of iron and brass wood screws dropped 7½ per cent. recently. The sales of wire remain small, and no changes in price have taken place. The Dominion Steel and Iron Co., of Sydney, C.B., have arrived in town with their second and third line. Up to the present they have carried only nails. They now have a stock of wire, barbed, and galvanized, at their depot, as well as a supply of steel bars. Mr. Max Morrell, their Toronto representative will shortly make a bid for local business in these lines.

Metals.

Little can be said this week of the metal market. Prices are stationary, and business generally is good. Stocks visible and floating, remain the same, so that these prices should continue for the next month or so. Copper might improve, and the price of lead must go higher if the Mexican trouble continues as the stocks are being rapidly depleted. All metals are in fair demand locally.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Medicine Hat, Alta.—J. E. Davies, manager of the Alberta Foundry & Machine Co., is considering extensions to the plant.

Weyburn, Sask.—It is currently reported here that the C.P.R. have purchased a site of twenty acres at this point on which to erect shops.

Montreal, Que.—The Ford Automobile Co., of Canada, Walkerville, Ont., will build a four-storey automobile factory, plans for which are being made.

Hamilton, Ont.—Lightning destroyed a machine shop on the dock of the Inland Lines, Saturday, August 9. The loss, $9,000, was covered by insurance.

St. John, N.B.—Geo. Wetmore, King St., St. John, N.B., will purchase all new equipment for a large machine shop being built for the C.P. Ry. at McAdam Junction, N.B.

Montreal, Que.—The Board of Commissioners have called tenders to build a boiler house at the Low Level Pumping Station, Point St. Charles. L. N. Senecal, secretary.

London, Ont.—The London Foundry, in which Mr. D. J. Cowan and other prominent financiers are interested, has been disposed of to a St. Catharines, Ont., firm, who will manufacture automobile parts.

Sarnia, Ont.—The Loughead Machinery Co., has decided to build a big addition to its present plant. The company recently entered the machinery field, and intends to erect a plant on the river bank, and cater to the marine trade.

Electrical

Calgary, Alta.—For the seven months of the present year the gross earnings of the Calgary Power Co., Limited, amounted to $127,591.47, as compared with $92,939.25 for the same period of last year.

..**White Rock, B.C.**—Electric light and power will shortly be added to the modern conveniences of White Rock, the B. C. E. R. having undertaken to run a pole line to supply current to the C. L. R. Co.'s two mills and the residences.

The Cape Breton Electric Co. are rushing their new concrete sub-station at Reserve. It will contain two large transformers and one generating set, and will be used for supplying power for Glace Bay and the tram line. The idea of the company is to close down their power houses at Glace Bay, and to do all the generating at the Sydney plant.

Ottawa, Ont.—The E. B. Eddy Co. is constructing a new power house and pulp mill in Hull at a cost of about $750,000. When the new power house is finished, the company's horse-power will be increased from 8,500 to between 16,000 and 18,000. The water power is being converted into a hydro-electric system. The company is also deepening and enlarging the fore bays and intakes of its plant, and increasing the draft tubes.

Aurora, Ont. — The electors carried both the money by-laws submitted to them recently. The first authorized an expenditure of $16,000 on new electrical equipment, while the second was for $5,000 to be spent on new pumps for the waterworks. The election finally disposed of the power question at Aurora for five years at least, that being the extent of the municipalities' agreement with the Metropolitan Railway Co. for power supply.

Sherbrooke, Que. — The recent acquirement by the city of the Lomas water power in the Magog river, above the present power station, opens the way for a further development of city power. The dam at the present electric light station can now be raised ten feet and it is estimated that this will give about 500 h.p. additional. The cost of development wil l amount to about $25,000. This will be, in all probability, the next power development work undertaken by the city, the development of Westbury being deferred to meet later requirements.

Stave Falls, B.C.—The Western Canada Power Co., Ltd., are engaged in raising the dam at Stave Falls, B.C., extending the power house, and doing other work necessary for the increase of the capaciay of the plant from 25,000 to 50,000 horse power. Contracts for the necessary machinery and equipment for this purpose have been made with Escher, Wyss & Co., of Zurich, Switzerland. for the turbines; with the Canadian General Electric Co. for the generators, and with the Canadian Westinghouse Co. for switchboards, etc. O. B. MacCallum, Secretary.

General Industrial

Oakville, Ont.—The ratepayers will aid James Langmuir Co., Ltd., to build a paint, oil and varnish plant here.

Campbellton, N.B. — The St. Lawrence Pulp & Lumber Corporation, Campbellton, N.B., will erect a sulphite mill.

St. John, N.B.—The flour mills of J. Harvey Brown, 2 Mill St., St. John, N. B., destroyed by fire, with a loss of $25,000, will be rebuilt and new machinery installed.

Calgary, Alta.—An English manufacturer through Messrs. Boyd, Faunt & Swain, has asked the city what offers it can make to induce him to erect a plant employing 1,000 persons.

Alliston, Ont.—The Defriez & Woodman jewelry manufacturing plant here has been purchased by Benedict & Proctor, Syracuse, N.Y. It is rumored that the factory will be considerably increased in size.

Shawinigan Falls, Que.—An extension to the paper mill, of The Belgo-Canadian Pulp & Paper Co., is planned. Plans and specifications are being prepared by the owners for both buildings and machinery. Machinery contracts may not be let until end of the year.

Calgary, Alta. — The Dominion auto garage was swept by a disastrous fire Aug. 4. Fifteen motor cars, a number of motor-cycles and the whole interior equipment of the buildings was destroyed. The total loss is estimated at $50,000.

Bridgeburg, Ont.—A new company to be known at the International Color & Chemical Co., Limited, has been organized at Bridgeburg, with a capital stock of $100,000, to handle certain patents for process of making paint without the usual grinding dry and grinding in oil methods now in use.

Prince Albert, Sask.—The paint factory of the Great West Iron, Wood & Chemical Co., established in Prince Albert, is now in full operation with a plant capable of turning out 1,000 gallons of finished products per day. The factory is a four-storey building 100 ft. x 150 ft., and contains the most modern machinery.

Montreal, Que.—Fire broke out Aug. 6 on St. George street in the premises of the Continental Upholstered Furniture Company, and swept through F. A. McReay's iron works, the United Paper Box Factory, and did considerable damages to the adjoining premises of V. C. Fuller and Jas. Cleveland, dye works, before the firemen could get it under control. The loss is in the neighborhood of $35,000.

Toronto, Ont.—Construction work is going on rapidly at the new brick and tile factory which the Provincial Government is building at Mimico. Completion will mark the advent of the Government into a new industrial field. An estimate of the producing capacity of the new factory gives a maximum daily output of 25,000 bricks. This is, however, slightly above the average, which will be about 20,000 per diem.

Sarnia, Ont.—Freight Traffic Manager Dewey and General Superintendent Wittenberger, of the G.T.R., were in Sarnia recently regarding the construction of a new elevator at Point Edward to replace the building recently destroyed by fire. Mr. Dewey stated that prospects were bright for the immediate construction of a much larger elevator than the one recently destroyed. The new building will be of concrete and steel, and will be absolutely fireproof.

London, Ont.—Work commenced last week on the erection of a new plant for the London Brick & Tile Co., which within six weeks will have a staff of from 20 to 30 men at work producing pressed bricks of various colors, roofing and floor tile and kindred products. It will have capacity for 20,000 bricks per day. The machinery building will be two stories in height, and will be 36 feet by 45 feet. The cylinder shed in which the pressed bricks are given their final course of the process, will be 85 feet by 36 feet.

Trade Gossip

Vancouver, B.C.—The Amalgamated Dry Dock and Engineering Co. is the name of the concern applying for a subsidy for a floating dry dock at Vancouver, to cost $2,500,000. It will be of the second class.

Toronto, Ont.—Luther Grinder Mfg. Co., Milwaukee, Wis., have opened a branch house at 126 Wellington Street W., Toronto, in charge of S. D. Burroughs, formerly sales manager at the home office. Within a few months they expect to build a branch factory, where they will assemble and manufacture all goods for Canadian trade.

West Indies Cable Rate.—As a result of the new subsidy arrangements toward which Canada contributes $40,000 a year, the new cable rate between Canada and the West Indies Islands will be 36 cents a word. The present rates are: To Barbadoes, 91 cents per word; St. Kitts, 89 cents; Trinidad, 98 cents; Bahamas, 45 cents; Bermuda, 42 cents.

British Trade Returns. — The July statement of the British Board of Trade shows increases of $17,436,500 in imports, and $25,880,000 in exports. The imports of foodstuffs increased $8,875,000, and raw materials about $5,000,000. The principal gain in the exports was in manufactured goods, which showed $20,000,000 more than a year ago, including $5,000,000 in cotton textiles.

Gaspe Bay Oil Possibilities. — Viscount Selby, chairman of the Eastern Canada Co. has the highest hopes of the oil-producing possibilities of the Gaspe Bay district. Shipping facilities there, are, he says, admirable. In view of the increasing attention being given to the adoption of oil in the Royal Navy, and the decision of the Government to secure supplies as far as possible within the British Empire, there opens up the prospect of another large Canadian industry.

Westinghouse Machine Co. — The Westinghouse Machine Co. May and June monthly shipments approximated $500,000, and in July $600,000. Orders at present warrant expectation that business for balance of the year will average $500,000 a month. Such a condition at this season is unusually gratifying, as summer months are usually dull. An official says: "I think I am justified in the assertion that the outlook assures net profits of $1,000,000 or more during the current year. The Westinghouse Machine Co. has entered contract to supply the Interborough Rapid Transit with three turbo-generator sets of 30,000 kilowatts each. In addition, they are constructing at Pittsburgh 14 generators ranging from 15,000 to 22,000 kilowatts each, and many others ranging from 5,000 to 10,000 kilowatts.

Contracts Awarded

Coniston, Ont. — The Riter-Conley Manufacturing Co., Pittsburg, has received a contract from the Mond Nickel Co. of Coniston, Ont., for a sintering plant.

Regina, Sask.—The City Commissioners have awarded Bruce, Peebles & Co., Ltd., Edinburgh, through their Eastern Canadian agents, the contract for supplying a 1,200 K.W. motor generator.

Bridgeburg, Ont.—The Turner Construction Co., 11 Broadway, New York City, has received the general contract for the erection of a two-story and basement reinforced-concrete factory building 60 x 80 ft. for the Mentholatum Co.

New Westminster, B.C.—The contract for the completion of the first unit of the north jetty at the Fraser river sandheads has been awarded to Broley & Martin, of New Westminster and Vancouver. The contractors agree to complete the jetty for $83,500.

Water-Works

Duncan, B.C.—The town will borrow $25,000 to purchase the plant of the Cowichan Waterworks Co., Ltd.

West Vancouver, B.C.—The corporation will borrow $100,000 to spend on a waterworks system.

Wood Working

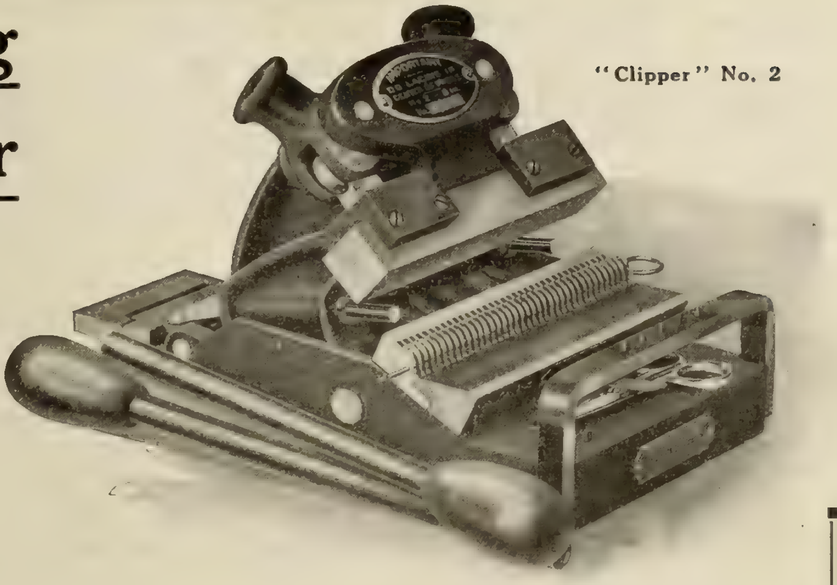
Port Coquitlam, B.C.—A company in which L. W. Hookham, late designer for Woodcrafts, Ltd., Calgary, holds the main interest, is establishing a show case and cabinet factory on Railway Ave.

Cranbrook, B.C.—The Standard Lumber Co. mill, two miles south from here, and one of the largest in the district, with a daily output of thirty thousand feet, has been totally destroyed by fire. The cause is supposed to have been a hot eccentric on an edger machine. The loss is estimated at $35,000, partially insured.

Charlottetown, P.E.I.—On Aug. 3 the sash and door factory and woodworking mill of H. P. Hogan on the Steam Navigation Co.'s wharf, was totally destroyed; loss $25,000, no insurance. Bruce, Stewart & Co.'s foundry and machine shops adjoining had a close call. The Hogan mill was built twenty years ago and was well equipped with machinery.

Liverpool, N.S.—The large box factory of the Sable Lumber Company at Wilkins's Siding, eighteen miles west of Liverpool, was destroyed by fire and 300,000 feet of lumber in the factory was burned Aug. 1. One H. & S. W. box car, one of the I. C. R., and several of the lumber company's flat cars were burned. The loss will be fully $50,000.

We are coming over to see our Canadian friends



"Clipper" No. 2

So many unsolicited orders have come to us from our friends across the border, that we have decided to open a series of Canadian agencies for the

"Clipper" Belt Lacer

TRADE MARK

and our representative is now in Canada, to present the matter to live jobbers and mill supply houses.

16,000 "Clipper" Belt Laces

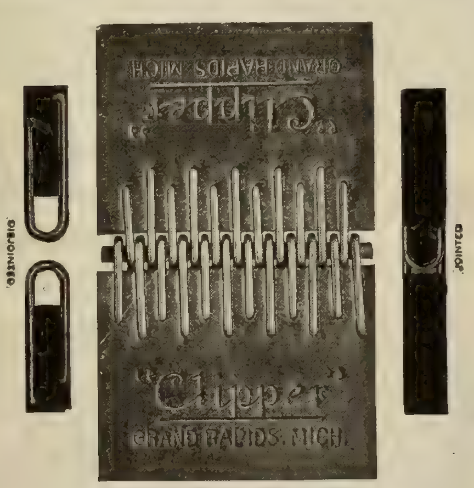
are now in use in the United States and are giving such satisfaction that every user is a "Clipper" enthusiast.

Laces a Belt in Three Minutes

and does it better

than any other system because the joint is stronger, truer, more pliable and more wear-resisting than you can get in any other way.

Retail price $15.00 f. o. b. Grand Rapids, Mich., U. S. A., to which you will add freight and duty—certainly less than $25.00 in all.



Photograph Showing Finished Lace

This small sum may easily be earned by the "Clipper" in a month by the machine-time and labor-time it will save.

Send us your jobber's name and address, and we will have our representative call on him.

W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

Winnipeg, Man.—The Commercial Power, Light & Coal Co., Ltd., has been incorporated to carry on the business of a light, heat and power company in all its branches; capital $250,000. Incorporators: Frederick M. Burbidge, Robert C. McPherson, Robert W. Killey and others of Winnipeg.

Catalogues

W. S. Mahaffy, Toronto, has sent us a pamphlet describing a line of warehouse and factory trucks. Copies may be had by writing.

Filing Made Plain.—Many years ago Wm. T. Nicholson, founder of the immense present-day business of the Nicholson File Co., prepared an elaborate and exhaustive book on the file, its history and use. The practical matter being valuable, and the original book out of print, the Nicholson File Co. have reprinted the matter, showing methods of using files, and working with them at greatest efficiency. The original booklet was named "File Filosophy," and ran through seven editions, many copies being used as text books in manual training schools and engineering colleges. The eighth edition has just come off the press, and a free copy will be sent to any applicant by the Nicholson File Co., Port Hope, Ont. It has an abundance of file facts and data that can be used every day in shop work.

Tool Makers to Their Majesties the Canadian Manufacturers.
We make **TOOLS** and **DIES.**

STEEL

We are thoroughly conversant with the latest methods of hardening and tempering this truly wondrous metal, and our experience with the leading grades of carbon and alloy steels enables us to choose the most suitable brand necessary to obtain the best results. The durability and success of tools and dies depends as much on the hardening and tempering of the steel used as it does on the workmanship and design. Our customers get the benefit of our experience. A trial will convince you. 'Nuff sed!

SECOND HAND MACHINERY FOR SALE

JUST AS YOU were attracted by the Caption "Second Hand Machinery for Sale," so will hundreds of other men all over Canada.

WHY NOT ADVERTISE that machine of yours that is getting too small or that isn't quite suited to the work for which it was intended?

Let "CANADIAN MACHINERY" find a buyer for your machinery or let it find you a second hand machine if you need one. Let "CANADIAN MACHINERY" connect you with good men if you are looking for them or with a better job if you desrve one.

Let it sell for you or buy for you, be it a factory or a machine, a man or a job.

"CANADIAN MACHINERY" is the Market Place for Machinery and Metal Men. Come to it if you wish to buy or sell.

Rates for a stand in the Market Place are 2c per word first insertion, 1c per word each subsequent insertion. Each figure counts as one word.

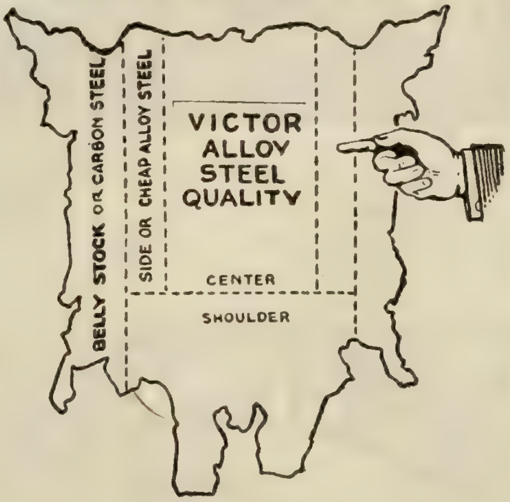
What Leather is to Belting
Victor Steel
is to Hack Saws

The first and basic reason for the success of the Victor Hack Saw lies in the unequalled quality of its steel—made to Special Private Formula. Victor Formula Steel is an expensive alloy containing Tungsten, Vanadium and other high-speed components.
For this reason Victor Hack Saws hold their edge the maximum length of time. Proof of this shows in black and white on our competing-test reports every day.



BELLY STOCK OR CARBON STEEL
SIDE OR CHEAP ALLOY STEEL
VICTOR ALLOY STEEL QUALITY
CENTER
SHOULDER

VICTOR HACK SAWS

are scientifically hardened—not surface burnt. Milled, not punched. Inspected, not merely glanced at. **Send for price list "C."**

Ground to the 1-2000 of an inch

''Detroit'' Drills are ground to that fineness—1-2000 of an inch. So however delicate a job you may have on hand, you can always get a

Trade Mark

"Detroit" Twist Drill

Trade Mark

to exactly fit your special needs. When a machinist comes to your tool room and asks for a ''27-64-inch drill,'' you should have a drill that will cut true to twenty-seven sixty-fourths of an inch.

Many an expensively machined piece has been spoiled because the drill holes were not exactly right. And the entire profit on the job has been lost through wasted time, labor and material.

Use ''Detroit'' Drills for Right-Size Holes.

Sold on a guaranteed basis.

Look for the trade-mark. Ask for Catalog ''R.''

DETROIT TWIST DRILL COMPANY

Improving Twist Drills Since 1886.

Detroit, 738-750 Fort Street Michigan

CLEVELAND TWIST DRILL CO
CLEVELAND O. U.S.A.
C
PERFECT
DOUBLE TANG
PATENTED
MARCH 26 1907
OCT. 9 1906

Drill Tangs Cannot Twist

or break off—you'll save mightily on your drill costs — if you adopt the

"Perfect Double Tang" Socket

Has two driving slots instead of one—the lower slot provides for a shank tang 25% to 60% thicker and sturdier than ordinary—That means a shank proportionately stronger and with ample reserve resistance to strain or stress.

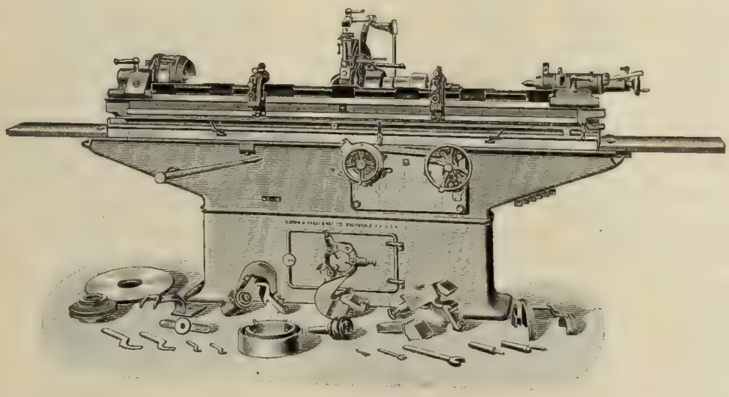
Broken tangs of old drills can be ground in a couple of minutes to fit the "Perfect."

All "Cleveland" Drills are furnished to fit in at regular prices.

Folder No. 18-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, Ohio Chicago



Observe Low, Compact Design of Head-Stock and Foot-Stock on the No. 14 Plain Grinding Machine

Capacity—10" Diam., 48" Length.

Such design is required to produce the necessary rigidity in a machine of this capacity. Beneath the headstock and footstock solid walls of metal extend to the floor. This rigid support of the work at the ends and the use of Universal Back Rests throughout its length is accountable for the accuracy of finished pieces when taking heavy cuts at fast speeds and coarse feeds. on this machine.

Consider these points with the Automatic Cross Feed and conveniences for operator that facilitate fast production.

Special Circular on request.

THE TAYLOR-NEWBOLD SAW
PATENTED
INSERTED TEETH IN THIS SAW TREATED UNDER EXCLUSIVE LICENSE BY THE TAYLOR-WHITE PROCESS.
MFG. & SOLD EXCLUSIVELY BY
THE TABOR MFG. CO.
PHILA. U.S.A.

Taylor-Newbold Inserted Tooth Cold Saw

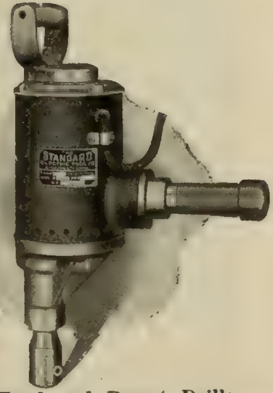
Standard Type for Steel Foundry, Forge and Machine Shop Use.

Special Type for Cutting Rails and Structural Shapes.

The TABOR MANUFACTURING CO.

18th and Hamilton Sts. - - Philadelphia, Pa.

HIGH POWER Portable Electric Tools



Hand and Breast Drills.
In ¼ in., ⅜ in., ½ in., and ⅝ in. sizes.

UNIVERSAL DRILLS
Operate on Both Direct and Alternating Current

0 to 60 CYCLES

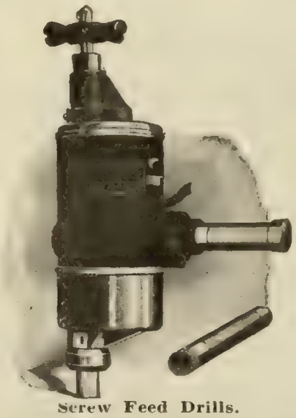
Simple, Strong and Rigid
Mechanical Construction
BALL BEARINGS in all Drills

Write for Test Report and Bulletins U-7, D-8, D-9 and G-6.

Guaranteed—The Highest Electrical Power.

Tool Post—Bench and Parallel Grinders, A.C. and D.C.

Canadian Agents—THE GENERAL SUPPLY CO.
TORONTO - OTTAWA - WINNIPEG



Screw Feed Drills.
In ¾ in., ⅞ in., 29-32 in., and 1¼ in. sizes.

Tool Post Grinder

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

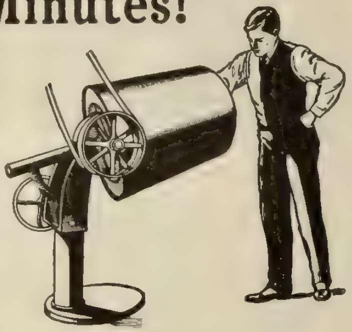
Save the Minutes!

Tumbling Barrels that can't be filled, emptied and the work inspected while running aren't worth the space they occupy. Every stop means minutes wasted—and money lost.



GLOBE TUMBLING BARRELS

will make things hum in your tumbling room. They'll do better work and faster work and you can fill them, empty them or inspect the work without stopping the barrels for a single instant. In addition the same barrel will handle either gentle or violent tumbling, which ever you want.

8 stock sizes—prices $50 to $170.
Ask us to send you our new catalogue No. 2.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

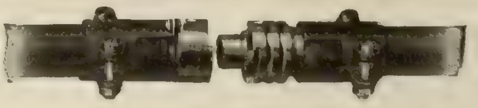
The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS
(Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.



Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

Sand Rammer in operation.

In Stock: — RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

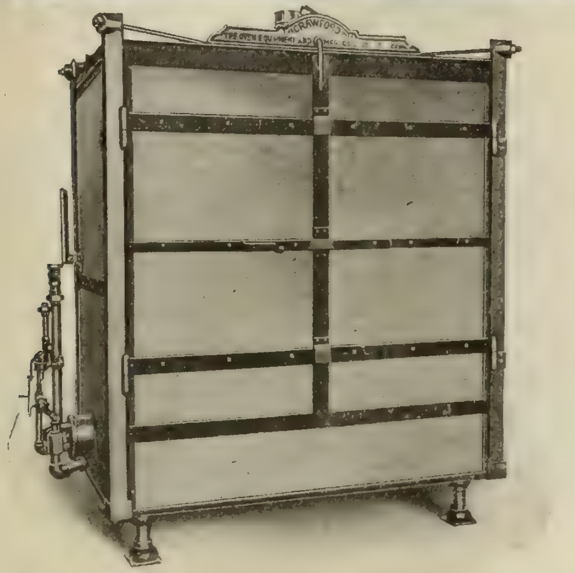
THE CRAWFORD SECTIONAL OVEN
PAT'D NOV. 20, 1906
THE OVEN EQUIPMENT AND MFG. CO. NEW HAVEN, CONN.



Repeat Orders Tell the Story

The world's largest manufacturer of certain electrical products bought a **CRAWFORD SECTIONAL OVEN** in 1904. This gave such good satisfaction that another was bought in 1905, five more in 1907, two in 1908, six in 1910, two in 1911, four in 1912 and seven already in 1913—a total of twenty-eight on twelve separate orders.

Experience with the Crawford, with its Enclosed Flame Gas Burner, has proved to this customer that in

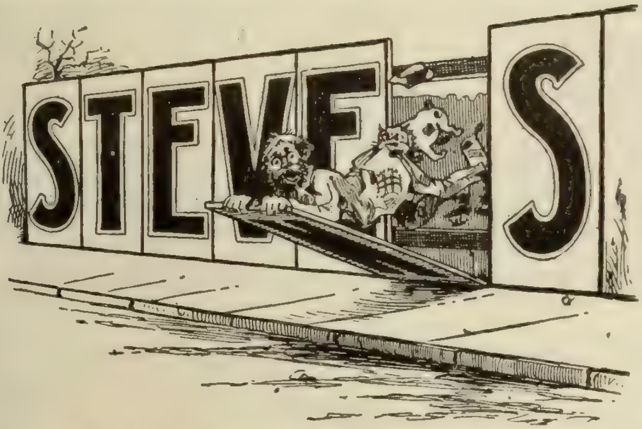
ECONOMY SIMPLICITY SAFETY
CERTAINTY OF RESULTS EASE OF OPERATION
UNIFORM TEMPERATURE POSITIVE AIR SUPPLY
PERFECT COMBUSTION

this oven is without an equal.

We make ovens of all sizes, for Drying, Baking Cores, Enamelling, Japanning, Lacquering, Bluing, etc. Let us know your needs, and we'll take pleasure in co-operating with you in meeting them.

Meanwhile, catalog C awaits your request.

The Oven Equipment & Manufacturing Co., NEW HAVEN CONNECTICUT
54-3



THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

FREDERIC B. STEVENS

MANUFACTURER

DETROIT, MICHIGAN. **Export Warehouse: Windsor, Ont.**

THE "NEW" PLANER

In this machine we claim to have higher efficiency than has ever been attained by any other system of drive.

Remarkably low running cost.

Built under Bateman's Patents by Smith & Coventry Limited.

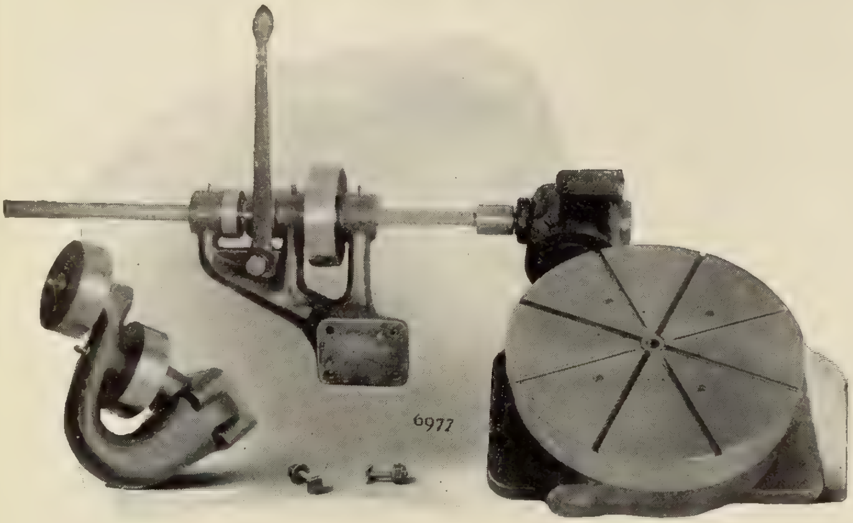
The Right Chuck For Every Job



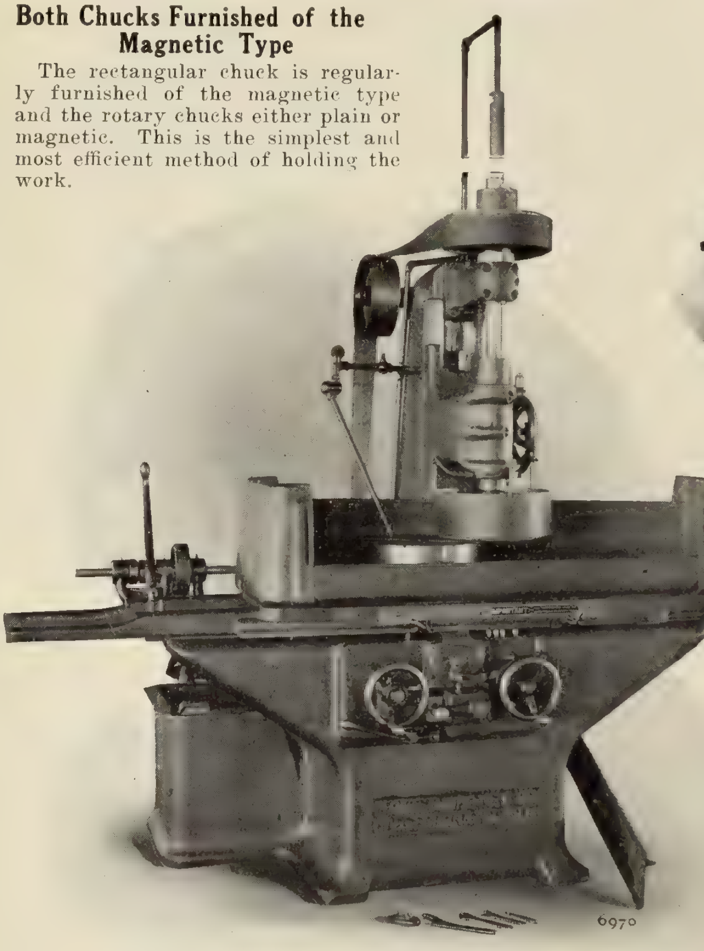
Plain Rotary Chuck and Driving Mechanism.

It has been proved that for certain classes of surface grinding the rotary chuck is most efficient and for others the rectangular reciprocating chuck gives the best results. This combination of chucks is furnished exclusively on the

P. & W. Vertical Surface Grinder

Both Chucks Furnished of the Magnetic Type

The rectangular chuck is regularly furnished of the magnetic type and the rotary chucks either plain or magnetic. This is the simplest and most efficient method of holding the work.



Rectangular Magnetic Chuck.

Rotary Chucks Most Efficient on Circular Work

Your circular work such as gear blanks, washers, rings, discs, etc., can be most efficiently handled by the rotary chucks, a single piece being placed at the centre of the chuck.

We furnish single, double and quadruple chucks, depending on the output you wish to make on each machine. The single and double rotary chucks can be tilted to an angle for concave and convex work.

Rectangular Reciprocating Chucks For Other Flat Work

For your plain surface grinding the rotary chuck is readily removed and the rectangular chuck substituted.

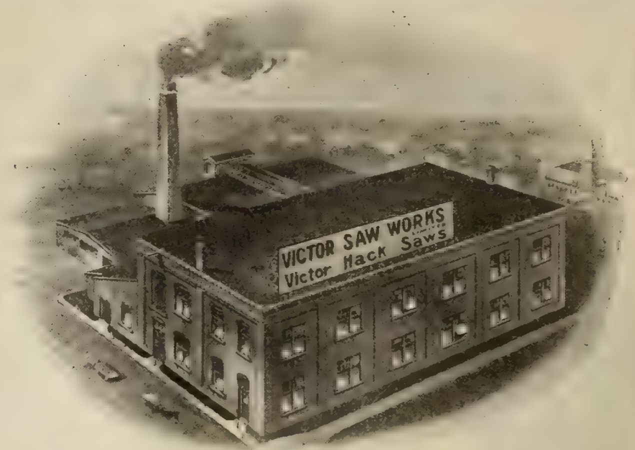
Here is the Result of Only 5 Years' Sales of the

Victor Hack Saw

in Canada

The Only Complete Hack Saw Plant in the Dominion



It has taken only five years for Victor Hack Saws to enter the Canadian field, overcome strongest competition and finally necessitate the erection of a separate Canadian factory.

Ten years ago Victor Hack Saws were unknown. To-day they are the new standard in hack saw efficiency — throughout the whole world.

Victor Hack Saws are made only from Victor Private-formula Steel. They are milled—not punched. Every tooth is a separate cutting tool. A Victor Saw for every metal. Made in a greater variety of styles than any other blade.

Send for Price List "C."

VICTOR SAW WORKS, LIMITED **Adam Street, Hamilton, Ontario**

Starrett Tools

Are Tools Born of Necessity

Every tool in the whole Starrett line is made to fill an actual need of the mechanic and they have always been the first tools in the field to fill this need.

When machinists needed a tool that combined the rule, square, mitre, and level and which had greater scope than any of these, it was the

STARRETT COMBINATION SQUARE

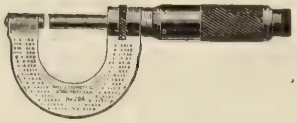
that first appeared as the tool to fill the bill. Now no real machinist is without one. Other companies have imitated this original Starrett tool, but it still holds its original superiority.

Again, when machinists needed a micrometer that could be quickly adjusted without delaying to make the total number of turns, it was the

STARRETT QUICK-ACTING MICROMETER

that first met the demand.

When machinists complained of their steel rules wearing round on the corners, it was Mr. Starrett who invented a process for etching hardened steel.



And so we might go on, telling of Starrett tools and how each first filled some particular need. But these instances are enough to show you that Starrett Tools are made for service and that is what you pay your money for. If you aren't familiar with the Starrett line send for Catalog No. 193 and learn about these tools. It will be worth while.

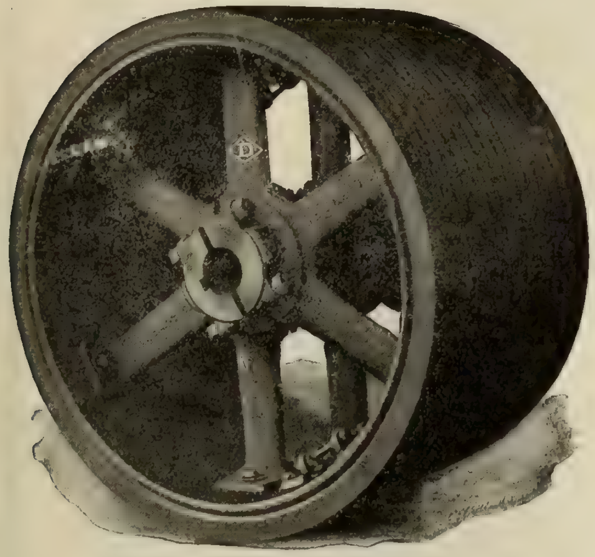
The Pulley Without a Peer



DODGE

IRON CENTRE
WOOD RIM
PULLEY

¶ The combination of wood and iron is an engineering triumph. The wood rim gives high tractile efficiency, tests showing that it is superior to iron in the proportion of 46 to 22. Lighter belts and less tension can be used thereby minimizing pressure on bearings, all of which decreases friction.

¶ It can be run at a higher speed than any other pulley, — one of these pulleys was tested to a rim speed of five and a half miles per minute without any resultant damage.

¶ Made solid and split in all sizes to twenty feet in diameter, for any strength, for any speed and for any service for which belting can be used. It is a pulley that is quite in keeping with the other members of the famous Dodge Line of Power Transmission Equipment.

DODGE MANUFACTURING CO., LIMITED

EVERYTHING FOR THE MECHANICAL TRANSMISSION OF POWER

TORONTO **MONTREAL**

16 in. Lever
POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to ⅞ inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

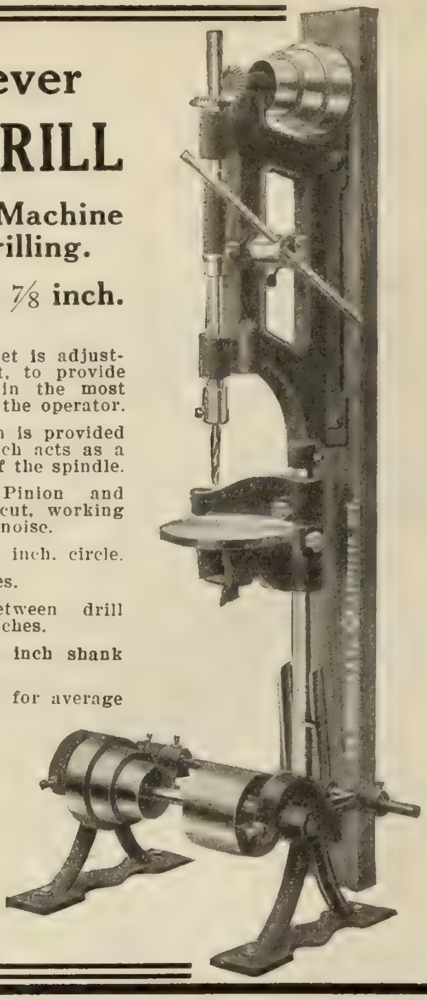
Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

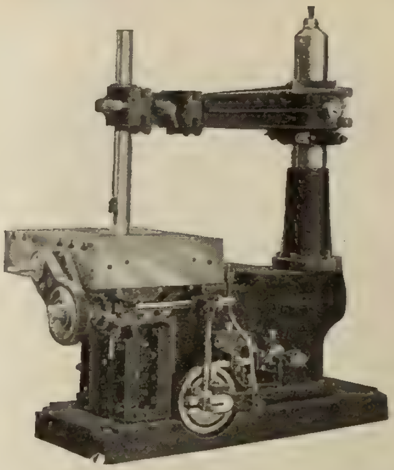
Speed of countershaft for average work, 300 per minute.



A. B. Jardine & Co.

Hespeler, Ontario

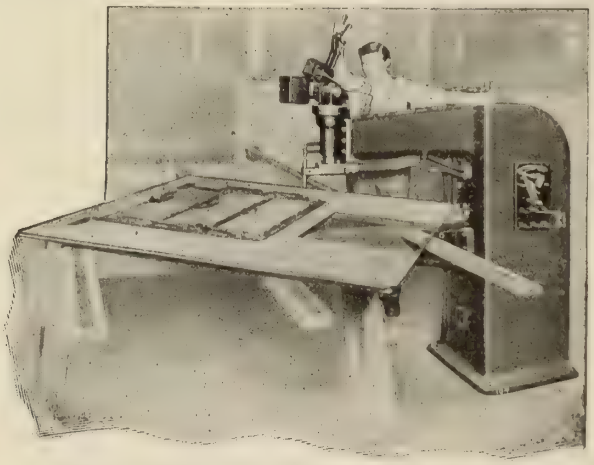
Keyseater and Slotter



Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

Baker Brothers, Toledo, Ohio.

RIVETING COSTS REDUCED



IT'S THE ELECTRIC WAY

This is an example of how one concern cut their costs over 90 per cent. in the construction of heavy ranges. Write for Bulletin No. 12, it's free, and tells you how to cut riveting costs by *spot* welding.

Bulletin No. 11 is another story, and tells all about *butt welders.*

Then get our free trial proposition.

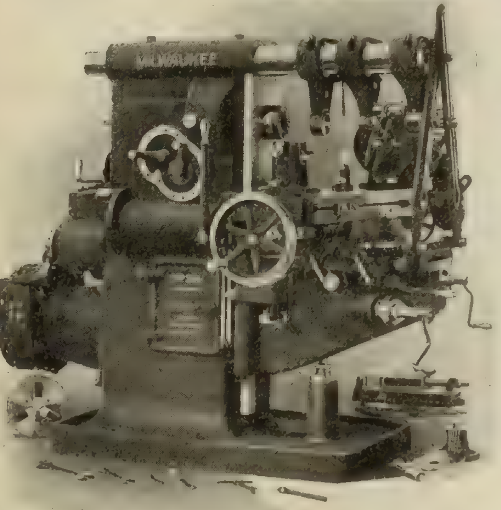
WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

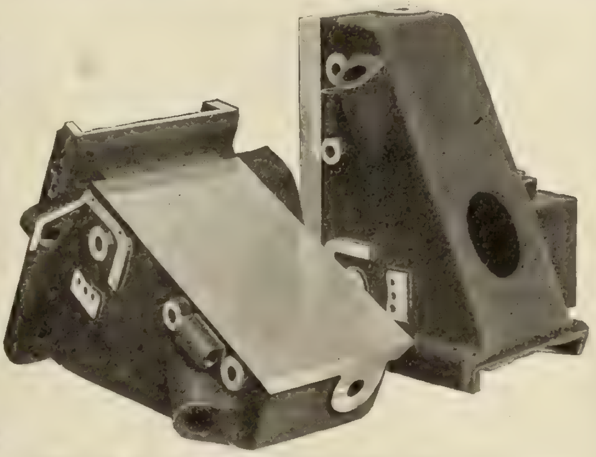
No. 2—KNEE and KNEE SLIDE

The strain on the knee of a milling machine is tremendous, as it must carry the weight of the saddle, table, and work, and at the same time withstand the downward thrust and the torsional strain set up by the work feeding against the cutters.



We adopted the box section form of knee, with its bearing on the column above the top plate of the knee slide, because we believed that it would withstand distortion better than any other form of knee, and its performance in years of actual practice has amply justified our judgment.

The top plate of the knee is made wide to give the saddle a firm foundation, and is cast solid, without any holes whatever, so as to avoid the inevitable closing of the usual slotted top when the saddle clamps are set tight or the cutting strains come upon it.



The knee slide is of extra width and depth, and extends upward to the overarms, giving rigid support to those members, and at the same time surrounding the spindle box, giving additional weight where it is most needed.

"WHYS" in favor of Milwaukee Millers—that's the unofficial name of our Catalog, of which this is but one chapter. Ask for your copy.

WINDSOR, ONTARIO

To Manufacturers:

A Modern City, from the residential point of view, **THREE RIVERS** is essentially featured to become one of the most industrially active and prosperous cities of the Province of Quebec.

As an economical site for production and distribution, **THREE RIVERS** should receive the careful consideration of industrial and manufacturing promoters in all lines—more particularly those where wood is the raw material, such as Agriculture Implements, Furniture, Vehicles, Sash and Door, Pulp, Paper, etc.

THREE RIVERS ranks as an important industrial City, boasting of numerous prosperous and very large industrial and manufacturing plants, such as pulp mills, saw mills, glove factories, cotton mill, whitewear factory, shoe factories, casket factory, chair factory, etc., etc.

THREE RIVERS has an abundance of good manufacturing sites, well situated. The city owns a large tract of land close to the wharves and crossed by the Canadian Pacific Railway; ample ground for new establishments will be ceded out of this tract, by the city, at a nominal price.

THREE RIVERS favors the creation of new industries by tax exemption. The St. Maurice Valley supplies an abundance of lumber of all kinds, which is practically laid at the doors of the factories.

The motive power developed at Shawinigan Falls and the water power of Grand Mere can run thousands of factories at a cost 25 per cent. to 35 per cent. less than anywhere else in Canada.

Electric Lighting is very cheap.

Labor is abundant, cost of living comparatively low, and wages reasonable.

THREE RIVERS has a fine water system — 4,000,000 gallons a day of limpid water, sterilized by filtration, through a thick compressed sand bed.

THREE RIVERS is an ideal distributing point for manufactured products, either by water or by the following railroads: Canadian Pacific Railway, Grand Trunk Pacific Railway, Canadian Northern Railway, Grand Trunk Railway, Delaware and Hudson Railway, Intercolonial Railway.

THREE RIVERS possesses a magnificent harbor, admirably situated, half way between Quebec and Montreal, and capable of berthing the largest trans-Atlantic ships, and a whole fleet of merchant marine, with a deep water area of 700,000 feet, wharves over a mile in length, permanent and removable sheds for oceanic freight, pens and shelters for cattle, cold storage, side lines, etc., etc.

Manufacturers

Look at it from whatever angle you wish, you will find nowhere else a better proposition than that offered by the Industrial City of **THREE RIVERS.**

For all information, write to the

Secretary, Board of Trade
THREE RIVERS, P.Q.

What
WELLAND
Offers

¶ ELECTRICAL POWER CHEAPER THAN COAL AT MINE PIT—Four plants generating 500,000 h.p. compete for your business. Power rates lower than any other city in Canada.

¶ LAKE SHIPPING BY THE WELLAND SHIP CANAL—Think of having freighters from Duluth, Milwaukee, Chicago, and steamers from the Atlantic dock in your own back yard.

¶ ALL THE TRUNK RAIL LINES IN CANADA — Eight great railroad systems place Welland without a rival in rail facilities.

Now Listen

Within the past three years Welland has secured more branch plants of American industries than any other Canadian Industrial City. To-day 165 American firms have Canadian branch plants. ONE-FIFTH OF THESE ARE IN WELLAND.

Send for the booklet *"Turn Wellandward"*—it tells the whole story of Welland's Industrial Supremacy.

All roads lead to London, the metropolis of Western Ontario

Unchallenged Radial Centre of the Richest Agricultural Section of the Dominion, claims attention as an important geographical and economic point for distribution of manufactured goods throughout Eastern and Western Canada.

Probably no city on the Continent possesses greater attractions for industrial workers, about 80 per cent. of whom own their own homes. There is no discontented industrial population and serious disturbances between capital and labor are unknown.

Raw materials, primary products, parts, machinery, etc., are brought to London from nearby sources at low cost of transportation. Coal, iron ore, lumber, hides and all sorts of raw products are obtainable here cheaper than most centres of the Dominion.

Hydro-Electric power and light supplied by Municipal Commission has reduced the price of these commodities **to cost of production.** Factory sites on railway siding—with interswitching to all railroads—can be obtained at exceptionally low prices and merely nominal taxation.

Young Man—The Problem in Business

Any system of developing the mind and character of a young man, which places him in the world at the age of twenty-five without any conception of what he is fitted for, is a failure.

¶ A business man, whose success has been brilliant, conspicuous and decided, is responsible for a statement which deserves the serious consideration and study of every big business concern and every executive who employs men for important positions.

¶ "My observations of three large firms employing upwards of twenty thousand men, extending over a period of several years, has convinced me that the greatest difficulty is to find men who have courage, imagination, large vision and high ambition. I do not know which of these qualities is most often lacking or which is most essential. Lack of courage comes most often to my attention, but lack of imagination and broad outlook produce the most serious disasters."

¶ The problem that confronts the executive of every big business firm, and the problem that confronts the future of every small business concern, is not a problem of how to get business or where to get business—but a question of where to find men that line up with the substantial material; that puts them in life's game, real contenders— men ready to take hold of a proposition for the purpose of gaining experience, driving out moral cowardice and developing a positive, forceful, intense personality.

¶ Some one said the other day that bankers loan money on the security of a clear eye, a good breath, sound teeth, a healthy body, a clean mind and a good job. The present system which we look to for the development of our young men does not give them these requirements. The average young man is afraid, filled with uncertainties, lack of decision, lack of vision, lack of experience—and all these things are set deep in a background of feeling that he is "above" the hard knocks that a man must go through on his way from a small position at the bottom to a bigger and better position at the top.

¶ I am not able to say why this weakness is, but thousands of executives have observed that there must be something wrong with the training and development of a young man during the first twenty-five years of his life, when at the end of that time he looks upon work as humiliating instead of a school which transforms his boyishness, crudeness and weakness into courage and manliness.

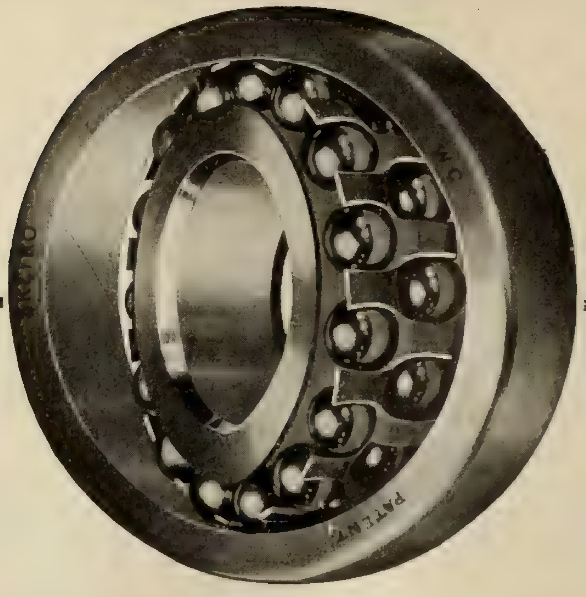
¶ Any system or method of developing the mind and the character of a young man which places him in the world at the age of twenty-five without any conception of what he is fitted for, what he wants to do, of the direction in which his future lies; any system which does not give him a personality that permits him to meet and convince other men; which does not prepare him to stand undiscouraged by mistakes and unaffected by success is a failure.

¶ Business is young—in fact, the principles of business are just beginning to be established and defined. But we must look to the Canadian Business Man for the answer to this problem. It it not a problem of tariff, income tax or the high cost of living. It is a problem of finding the secret of training and developing young men so that they are not afraid of work, so that they do not consider work a disgrace, and so that they may have some definite preparation for the career they are best fitted for, and some definite conception of what this career demands.

¶ To-day there are hundreds of positions at five thousand dollars a year in Canada unfilled because there are not men with the experience, the ability, the sincerity, the enthusiasm and the intensity of purpose that measure up to their requirements.

Efficiency

These articles are copyrighted, and must not be reproduced in part or whole without the permission of The MacLean Publishing Company.



Instantaneous Self-Alignment

The key to successful bearing operation is instantaneous and frictionless self-alignment. There is one famous make of ball bearings that possesses this all important feature—SKEFKO.

This instant adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary ball bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature inherent in the bearings themselves, as in Skefko Bearings, is obvious, for the swivelling takes place on balls instead of on a solid bearing.

SKEFKO

"Self-Aligning Ball Bearings"

Eliminate friction, reduce wear, obviate repairs, increase the life of machines, require a minimum of attention and cut down maintenance cost.

Skefko Self-Aligning Double Row, Double Capacity, Double-Life Ball Bearings cost no more than ordinary bearings, and are made in international standard sizes. Their use is practical under any load and speed condition.

We can show you where Skefko Ball Bearings will save power, attention and lubrication, and simultaneously increase your output and improve the quality of your work.

Your best interests demand that you investigate.

Ask us for "Skefko Bulletins."

Problems To Be Considered By Manufacturers Looking For A Suitable Plant Location

By C. W. BYERS

ALMOST every week there come to Canada American or British manufacturers seeking a location for a branch factory. They make a thorough examination of the most attractive centres, always having in mind the most convenient spot to which to draft their raw material, manufacture their product, and distribute to the consumer. Many concerns must locate between two given points—say, Windsor and Montreal, so that, if their plant is in the United States, east of Detroit, communication between the parent and the branch plant will be easy. If the headquarters are further west—say, in the vicinity of Chicago or Indianapolis, then a Western Canadian city is likely to be chosen. Depend upon it, however, the firm seeking a site for a plant has an idea in what province it will locate, and only extraordinary inducements will alter its decision.

Independence of Industries.

The supply of raw material has an important bearing on the choice of location. Some months ago, a Pittsburgh manufacturer came to this country in quest of a site. He had no particular city in view, in fact, he passed from one to another haphazardly. His limits were the Detroit River and Montreal, but there was this important stipulation:—the plant must be located within easy distance of a malleable iron foundry where he could obtain castings for his product. Thus, his choice was narrowed down to less than a dozen cities. Here we have an instance of one industry bringing another, and it is the multiplicity of industries, that has aided such cities as Hamilton, Brantford and Windsor to secure additional and subsidiary plants to help increase their population and wealth. A town that secures an iron industry is laying the foundation for scores of others which will follow in its wake.

Parent and Branch Plants.

Windsor as a manufacturing town from a geographical point of view, is perhaps more fortunate than Hamilton. The latter city has credited cheap power chiefly for its success in securing new industries. Windsor is a common sense location for firms operating in Detroit, and numerous firms, particularly Ford, the automobile makers, have put up large branch plants on this side the Detroit River, either in Windsor or in one of its many thriving suburbs. Nine motor car companies are established

KAKABEKA FALLS, PORT ARTHUR, ONT.

there, most of them branches of American concerns. Thus, the proximity of the branch plant to its parent is one of great importantce.

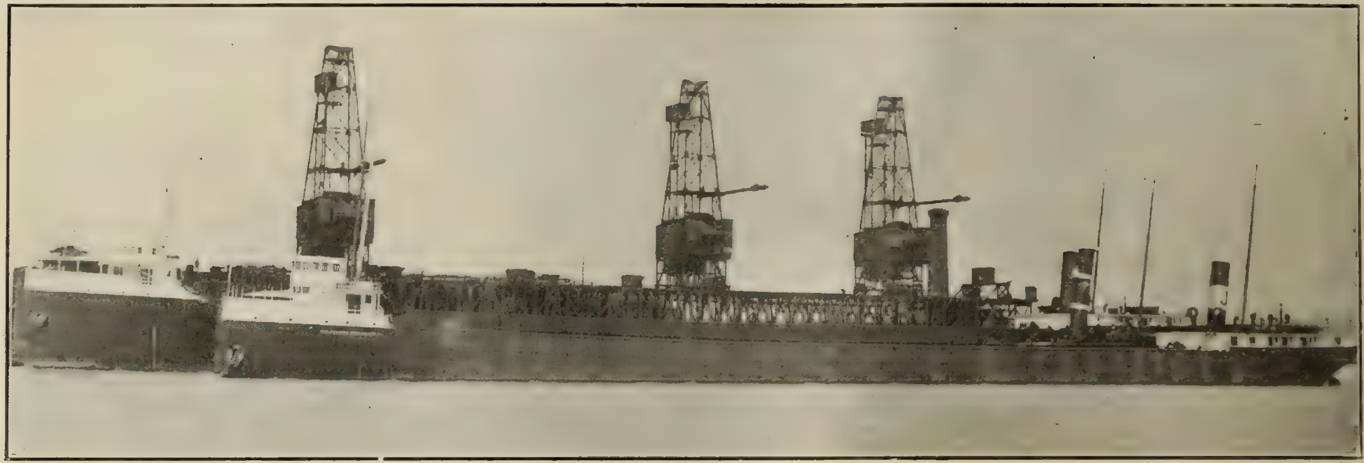
Municipal Inducement Feature.

Judging from recent examples, the prospective builder is influenced by circumstances that do not count for much in the long run. There have been firms who located in the city which gave them a free site and tax exemption for a number of years. Some cities go further, and offer water and power at ruinous rates. This procedure results in foolish competition among the various municipalities. There was one notorious case this year of an immense corporation going around looking for the best offers, but they have not located yet. Time and again it was reported that some city had landed them, and by-laws were passed.

One of the best known industrial commissioners in Canada, speaking to the writer on this subject recently, said: "Subsidies are all right to build a town, but this practice does not always work out well. Small towns are often 'stung' by corporations who have been granted bonuses. My belief is that a firm which cannot stand on its own legs is not worth going after. Our best industries were not secured that way. The manufacturers come to us saying they did not wish to be given something for nothing; all they wanted was to be assured that they would not be overcharged for their site, etc. It is the work of an industrial commissioner to see that firms coming into his city are protected. He can help them in scores of ways; by securing options on property, for instance."

Essentials of Business Success.

The city of Indianapolis in a pamphlet on "Six Essentials of Successful Manufacturing," states the following main factors upon which business success depends: Shipping facilities, power, labor, raw material, market and living conditions. It says: "The availability of a factory site cannot be judged solely by the excellence of its shipping facilities, for it may be correspondingly weak in fuel and labor. It cannot be fairly judged by any one factor, or by any two or by any three. It must be judged by the strength of the entire six factors in combination."



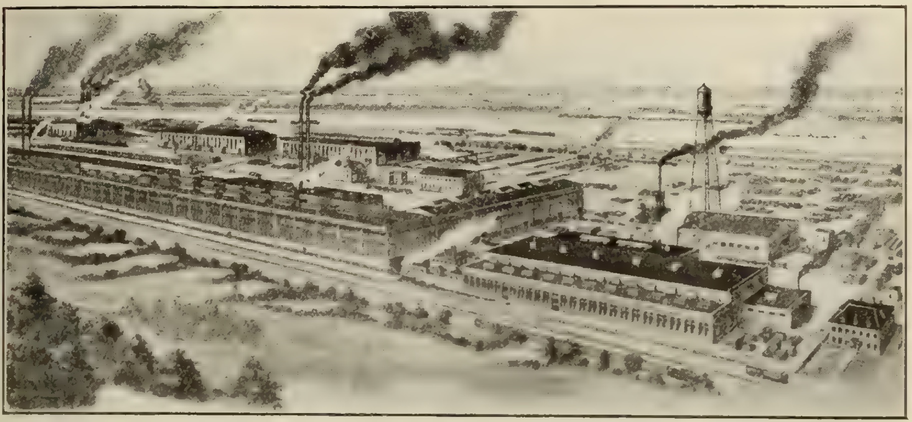
The Power Feature.

One of the most important of these is **power.** If the prospective industry is of any account, it will require machinery of some kind or other, and power to run it. The form in which power is available will determine to a large degree the size of plant and the amount of equipment necessary.

Water Power.

Many cities are in the neighborhood of water power which can be transmitted over long distances and supplied cheaply. Such cities are in enviable positions. Other towns, like Thorold for instance, abound with water powers of sizes suitable for individual establishments. This accounts for the tremendous strides made in recent years by the towns of Thorold and Merriton, which seem to be the Mecca for paper-making industries, in particular. Pilkingtons Ltd., the English glassmaking firm, no doubt, selected Thorold because of its remarkable facilities for supplying cheap water power.

Towns like Owen Sound and Guelph have their own electric power plants, and are able to supply it to manufacturers at as near cost as possible. The advent of the Ontario Hydro-Electric Commission placed those towns within its belt in a position to make favorable terms to American manufacturers contemplating the erection of branch plants. Many a town in Ontario which hitherto had nothing to commend it, has been able to boost itself as a place where cheap power is available. Cities like Brantford and Windsor which, by their very position and enterprise became admirable centres for manufacturing purposes, have considerably enhanced their attractions by securing favorable terms from the Hydro-Electric Commission.



PLANT OF CANADIAN CAR & FOUNDRY CO., LTD., MONTREAL.

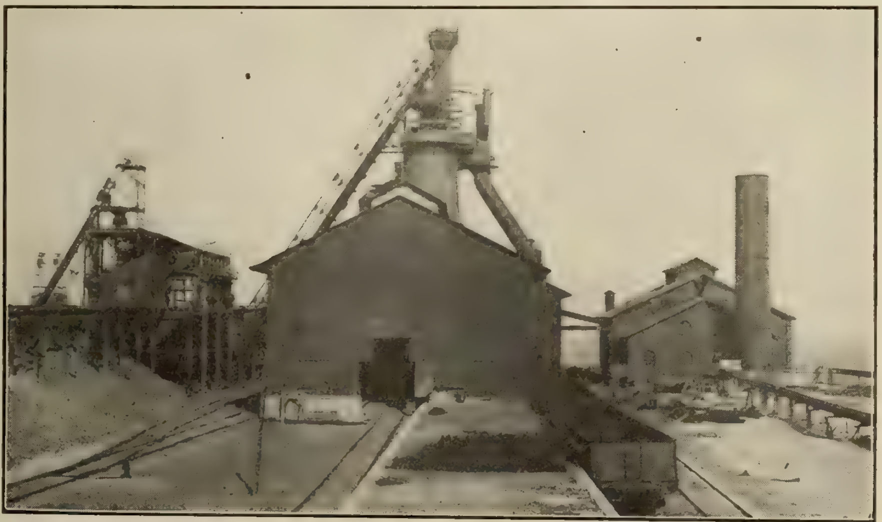
VIEW OF THE WESTERN DRYDOCK AND SHIPBUILDING CO. PLANT, PORT ARTHUR, ONT.

Natural Gas For Power.

Natural gas has played a prominent part in Canada as a fuel, and many cities unable to boast of their electric power, have been able to carry as much weight in their offers by quoting reasonable rates for natural gas. Windsor, Ont. besides having cheap electric power, supplies natural gas at 12 cents per 1,000 ft. which is equal to coal at $2 a ton. Brantford charges 40 cents for the first 8,000 feet used, and 35 cents for succeeding amounts per month. Calgary estimates the cost of its gas at $12 per h.p. per annum. London charges 80 cents for illuminating gas used for manufacturing purposes.

Coal.

The question of coal enters largely into the situation. For, if water power or natural gas are not available, a steam power plant with coal fuel becomes necessary. For that reason, most towns and cities in their advertising literature, take care to state how near they are to the coal fields, and the price of coal. Edmonton makes much of the fact that there are coal beds containing 60,000,000 tons of coal directly under the city, that thirty mines are operated, and that coal is sold as low as 75 cents a ton for steam purposes, and $4.50 a ton for domestic purposes. Welland advises firms locating there to charter a steamer to bring coal across Lake Erie at a



CLOSE VIEW OF BLAST FURNACE, PORT ARTHUR, ONT.

saving of 35 cents a ton on the ordinary prices in Welland. The price of coal in Canada is such a variable quantity that many cities do not venture to quote prices.

The second point to be considered by a manufacturer locating is the shipping facilities. That this feature is appreciated is easily seen by a glance at some of the literature sent out by industrial commissioners. The pamphlet sent out by Windsor has a cover bearing an attractive map showing the numerous railways which pass through it en route to the east and west, as well as the steamship routes by way of the Lakes. This, Windsor considers "The Logical Location," because of its marvellous shipping facilities. The city of Sherbrooke, Que., includes among its literature a single sheet map of the surrounding district on a large scale, which is very striking. It is easy to see at a glance that Sherbrooke is in the midst of a very populous district, supplied plentifully with railways, and in close proximity to the New England States. These points are emphasized by the city of Sherbrooke regarding its shipping facilities. It is within a night's ride of all New England points, making it possible for head office officials to visit their Canadian branches often and with a minimum loss of time. Sherbrooke is the Canadian terminus of the Boston & Maine, and through trains are run from both Boston and New York. It is on the trunk lines of the C. P. R. and G. T. R. and contains the head office of the Quebec Central Railway.

PLANT OF THE PLYMOUTH CORDAGE CO., WELLAND, ONT.

ST. JAMES AND McGILL STREETS, MONTREAL, WITH EASTERN TOWNSHIPS BANK BUILDING ON THE LEFT.

An American firm who located in Owen Sound last year, told the writer that they chose that town because of the excellent facilities provided for reaching the Western trade by water. The same argument might be put up by firms in Sarnia, Windsor, or Midland, for all these are situated on Lake Huron, and are within easy distance of Fort William and the West. Many eastern firms, including some from the Maritime Provinces, have recently erected branch plants in Fort William and Port Arthur, thus being hundreds of miles nearer the West, but many of these were firms who owned factories in the East which were able to take care of the more important trade of Ontario and Quebec.

In the case of large plants which require to import enormous quantities of raw material, it is essential that their location be in a town with a good harbor having good docking facilities. It will be interesting to note what some towns offer in this respect. Take Three

Rivers, Que., which among its industries boasts of the Canada Iron Corporation Ltd., employing 300 men. This town has a wharfage a mile in length, with a basin 400 x 1,500 feet, capable of receiving the largest ocean crafts. The wharf has a surface area of 700,000 sq. ft., with permanent as well as movable sheds, and sufficient railroad sidings to accommodate large incoming and outgoing cargoes. Besides this, the shipping facilities are augmented by the C. P. R., G. T. R., I. C. R., St. M. V. R., and the S. & H. R., which run 35 trains daily. The R. & O. Navigation Co. also run a day and night service, while an electric railway is also projected.

One of the reasons why Welland has received so many large industries in the last few years is because of its location on the Welland Canal, its nearness to Buffalo and other American cities bordering on Lake Erie, as well as to Canadian cities served by ports on Lake Ontario. Welland is also favored with a wonderful system of railways. Its great rival in this respect is Port Colborne, located at the month of the canal on Lake Erie. The chief reason why the Buffalo Furnace Co. went there was because of its exceptional shipping facilities by water. The same advantages may be claimed by Thorold, Merriton, and St. Catharines, the first of which has the additional attraction of an abundant supply of water power.

Here again, care must be taken not to attach too much importance to one link in the chain, for, whereas some towns by their geographical position have unrivalled shipping facilities, yet are they seriously lacking in others of the essentials which go towards profitable manufacturing. One of the towns just mentioned is lacking lamentably in a particular regard, and firms who have located there, have since regretted their action because of their inability to obtain suitable houses for their workpeople. So serious was the situation, that certain firms refused to build until assured that the situation would be relieved. One large firm in particular launched out on its own, and erected hundreds of cottages for its employees.

LAURENTIDE PULP AND PAPER CO. PLANT, GRAND MERE, QUE.

DOG LAKE FALLS, PORT ARTHUR, ONT.

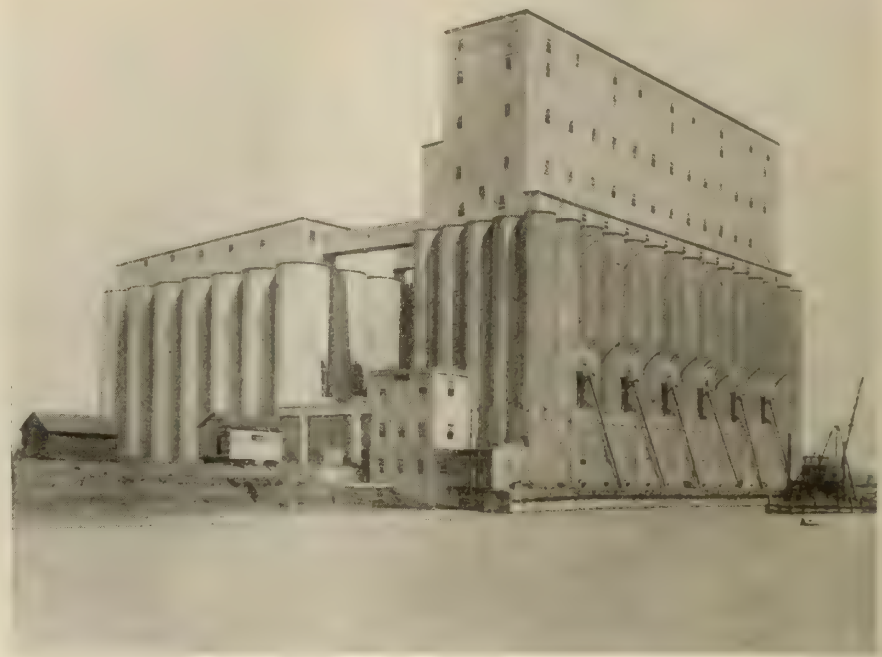
Railroad Spur Lines.

Before leaving the subject of shipping facilities, it will be apropos to refer to sidings and spur lines which naturally come under this heading. Some time ago when "Canadian Machinery" was aiding an American firm to secure a two-storey building for manufacturing purposes, it was noticed that many of the buildings for disposal were not situated near sidings. In many cases it would have been necessary to truck the product for a considerable distance. To a firm, however, who are willing to build, sites are available in every progressive Canadian town, near to sidings. In many Ontario towns, particularly those around Galt, this work is done by the electric railways, which are very plentiful.

Markets.

The product to be manufactured determines to a great extent the location of the plant. Other conditions being satisfactory, it is safe to say that the factory should be as near as possible to the consumer. When the market is a big one, and evenly distributed across the Dominion, it is often found cheapest to establish several plants, covering several territories. The Steel Company of Canada do not confine their activities to Hamilton. They have plants in Toronto, Belleville, Montreal, and are now erecting one at Fort William which will assist them to cater to the West.

Roughly speaking, the Canadian market is divided into three sections—the Maritime Provinces, the West, and the heart of Canada, which extends from Quebec to Fort William. It is because of Ontario's central location that the largest percentage of industries are located within its borders. The same conditions exist across the border, though to a less marked extent, and it is only natural that branches should be located on this side as near the parent industry as possible, yet in a position to look after the market from Vancouver to Halifax. It has often been remarked that the industries landed by Western cities are those which cater to a market which is more or less local. The market usually is where the people are, and that is in central Canada. If this argument holds good, then the large industries which are coming to Canada in the next ten years, are coming to Ontario and Western Quebec. In several notable cases where the product finds a Western market, the headquarters are centrally located. Take the manufacturers of harvesting machinery for instance: The largest are in Hamilton and Toronto. In the United States the centre of population and manufactures has moved steadily westward, past Pittsburgh, and is now located somewhere near Indianapolis. The same has been happening in the Dominion of Canada, though the movement of this centre has been later and perhaps more gradual.



GRAND TRUNK PACIFIC ELEVATOR, FORT WILLIAM, ONT.

VIEW OF DRYDOCK, WESTERN DRYDOCK AND SHIPBUILDING CO., PORT ARTHUR, ONT.

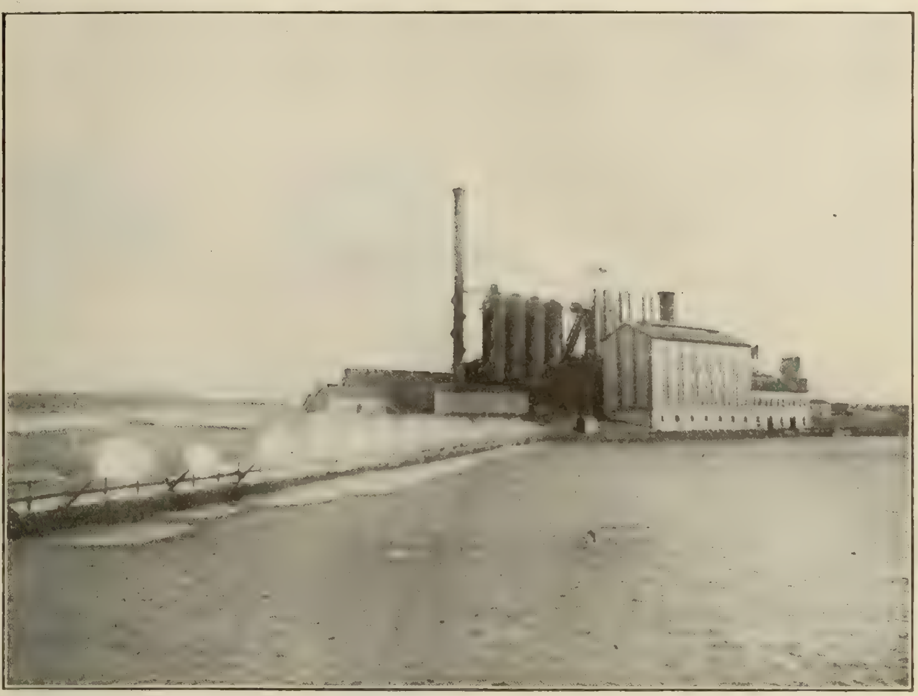
For many years Montreal must have been the manufacturing hub of Canada, but with the development of the West in the last thirty years, and the enormous industrial expansion around Port Arthur and Winnipeg, the centre has travelled westward, until to-day the true centre must be nearer Toronto than the Metropolis. Visitors to Montreal are impressed by the dense population within that city's limits, yet nowhere in Canada can we meet with such a largely populated area as is to be found along any radius from Toronto extending north, south, east or west.

That the Canadian market is enormous and undeveloped is made evident every day. The British manufacturer who has been rather tardy compared with his American cousin in plucking the plums, is now coming across with his incomparable wares, and is meeting with success. Handicapped by long distance, he has first established a hold, and is now aggressively following up with branch plants. Recent developments show that the Canadian City seeking new industries must pay attention to firms both in Great Britain and the continent of Europe, many of whom are on the verge of new departures.

The subject of **market** is one neglected by industrial commissioners in compiling their literature. True, it is an elusive and difficult subject to handle, yet one of vital importance to the manufacturer who desires to know what chance his product has for sale in that particular district. Much will depend on other industries already in the locality, and the class of people who compose the population. For this reason the method adopted by Welland of providing a list of articles manufactured within its limits is a good one. In a manufacturing city, there is often an opening for subsidiary concerns who will find a ready market for their parts which formerly were imported. The writer noticed an instance of this in Levis, Que., recently; where, a foundry was opened to make castings in iron, aluminum and brass for the local shipyards and engineering concerns.

Raw Material.

What effect this subject has on the location of industries is clearly seen in the iron trade, the most important industry on this continent probably. Iron ore has not been developed to any extent in Canada as yet, although geologists claim that there is plenty of it in certain districts. The majority of the iron ore used in this country is imported from the United States, and for that reason development along the line of blast furnaces has not been very rapid. The tendency seems to be to manufacture pig iron on the American side, and to import it. In the iron industry then, pig iron becomes the raw product, and manufacturers when considering the location of a new plant, must take this matter into consideration. It is then that the question of shipping becomes important, and this is one of the secrets of the success of such cities as Windsor, Hamilton, Welland, Fort William and Port Arthur. It is very clear why such places swallow up the leading iron industries that come to this side. The situation will be complicated, however, by the advent of the United States Steel Corporation and the Buffalo Furnace Co. of Port Colborne, etc., who will breathe new life into the manufacture of pig iron.



BLAST FURNACES, NOVA SCOTIA STEEL AND COAL CO., SYDNEY MINES, CAPE BRETON.

Nova Scotia and New Brunswick have reason to be thankful for the fact that they are within easy reach of Newfoundland, from whence comes a large percentage of the ore used in the iron and steel industries of the Maritime Provinces. Sydney is a splendid instance of the importance of having raw material near at hand. If only these provinces had the population of Ontario with its multitude of industries, that part of Canada would quickly become to the Dominion what New England is to the United States. As it is, Sydney, situated at the extreme of Cape Breton, is handicapped in its effort to secure the trade of the hub of the Dominion. That it intends to have its share of the market is shown by the recent move of the Dominion Iron and Steel Co., who have established depots in Toronto and Western Ontario, and have already made serious inroads into the iron and steel trade. Particularly is this true of nails and wire, for which there is a tremendous demand from the West, supplied until now chiefly by American and Ontario manufacturers.

C.P.R. FREIGHT YARDS AT FORT WILLIAM, ONT.

Manufacturers who attach more importance to the subject of raw material than to market, railway facilities and labor, will be inclined to favor inland towns where the particular raw material required is plentiful. This is not true in every case. There is at present being erected in Thorold, Ont., one of the largest paper mills on the continent — that of the MacCormick interests, of the Chicago Tribune. The pulp wood required for this plant will be shipped from the Island of Anticosti. Many large paper manufacturers, however, have chosen to build their plants right at the source of supply, which is resulting in a large ingress of capital to the district surrounding Three Rivers, Que.

Publicity literature should contain a clear cut statement of what raw material is available right at hand, and care should be taken not to compile a list of materials that are not readily available, except when accompanied by a clear explanation of how they may be secured. The statement made by the industrial commissioner of Ottawa has, in this respect, an honest, business-like ring about it:

"For woodworking, paper-making, and kindred industries; raw materials are available in the city and within easy access. Timber and other materials abound throughout the district. These include, ash, apatile, beech, basswood, birch, barite, corundum, clay, cedar, elm, granite, graphite, iron, hemlock, limestone, marble, marl, mica, maple, magnesite, peat, pine, poplar, phosphate, sand, water."

Those who know Ottawa will agree that this statement is not exaggerated; in fact it is almost an underestimate. In that list there are several items that are almost negligible, yet there are others which mean so much to the life of Ottawa, they should be put in big, bold type.

The town of Sault Ste. Marie, Ont., was asked to furnish a list of raw materials and replied in the following modest terms:—

"We have an abundance of raw material in the way of all classes of lumber, and there are large deposits of iron ore in the immediate vicinity. The Algoma Steel Corporation would be in a position to furnish such steel products as would be considered raw material for other lines of manufacture."

Winnipeg claims the follows: Grains of all varieties for flour and cereals, wool, flax seed, sugar beets, hides, clay, straw, limestone and sand; iron deposits, on water navigable to the city, gypsum, peat, salt and manganese.

The Labor Feature.

The supply of labor is a problem which Canadian manufacturers have been compelled to battle with for years. Various cities will tell you they have an unlimited supply of labor, skilled and unskilled; mostly unskilled, might be added, for the new manufacturer usually has to turn in, and train a staff of men to do his work. It is a natural condition in a new country. A prominent Canadian shipbuilder was speaking to the writer recently of labor conditions, and expressed the heartfelt wish that conditions would soon improve. He gave several instances of expert workmen coming to this country from British shipyards to whom he was willing to pay six and seven dollars a day. They stayed with him for a year, and just when they had become indispensable, an American shipbuilder came along and offered them ten dollars, which to the Canadian was a prohibitive price.

The tendency for many years has been for skilled workmen to pass across the border into the United States where wages are slightly higher, although of late there has been a dropping off in this practice, Canada having reached a point where she can offer inducements almost equal. Nevertheless, the most profitable method for a new manufacturer to adopt is to thoroughly drill his raw recruits in his work, and thus create his own skilled labor. In the end, if he is able to retain them, he has a more reliable and cheaper staff of employees than if he had scoured the country for experienced hands. Such employees as a rule are more faithful to a firm than those who have known the fruits of their skill for many years.

American Workmen Don't Settle.

It is customary for American firms establishing branches in Canada to transfer a portion of the men from the parent shop, and to use these to train the raw material obtained in Canada. It has been found, however, that men who have been used to the noise and bustle of American cities, soon sicken of the new country and, find their way back to the old haunts, leaving the manufacturer hopeless and exasperated.

Trade unions have been organized in Canada, followed ultimately by labor disputes aggravated by the importation of new labor, but Canada has been exceptionally free from long drawn-out strikes characteristic of the older countries. Labor disputes are usually short-lived, and generally end in an amicable arrangement between the masters and men in a very short time.

The Province of Quebec is one of the most productive sources of labor supply in Canada. The population is large and increasing at an enormous rate. During the past fifty years there has been a considerable exodus of textile and other workers into the New England States, but this has almost ceased now owing to the growing attractions on this side. The French-Canadian will work for a reasonable wage, he is industrious, and is not prone to disturb the industrial peace. Once he has been trained, he can usually be depended upon. It is stated that Three Rivers, Que., although employing thousands of operators in its combined industries, has never had a strike.

Living Conditions.

Workmen's houses, streets, recreation grounds, public libraries, schools, churches, etc., are things which concern the manufacturer indirectly. Some months ago the writer drew attention in "Canadian Machinery" to the fact that a growing Ontario town failed to secure a large steel industry, even when that town had practically been decided upon as the most suitable location. Before arrangements had been finally completed, however, several of the firm's foremen brought their wives over from the American side to see their new home. When they saw the place, an objection was raised—a woman's objection—that could not be overcome. In the end, another town was chosen hundreds of miles away, which contained comfortable cottages, well paved streets, and better living conditions.

It is an indisputable fact that if a manufacturer is to get the best out of his workmen, he must see that their lives are happy and healthy. There are several notable examples in England of large concerns planning model cities in which it is a pleasure for the working man to live. It is significant that these were corporations which went ahead and prospered, and were seldom troubled with industrial disturbances. A firm which would look after the welfare of the man in his home would not be unjust in the matter of wages.

There are many instances of welfare work of this kind being carried out successfully in Canada, as well as in the United States. Atention might be drawn particularly to the model cottages erected by the Plymouth Cordage Co. of Welland, Ont. They are of frame construction, semi-detached, although perhaps rather .sombre in .appearance, the timber used being dark in color. This is relieved somewhat by the green shutters, and white porches. The lawns are extensive and neat. Among the cottages are interspersed large boarding houses of similar design, which must cheer the heart of the laboring man who is used to something quite different. A considerable area is laid out around the Plymouth Cordage Co.'s works, the streets being of considerable width. The scheme makes this plant and this district like a paradise, and contrasts favorably with other sections of the town.

The dearth of workmen's houses has become so acute in several Ontario towns that steps have been taken by semi-philanthropic corporations to invest large sums in erecting frame dwellings, containing modern conveniences: to be rented to workingmen at reduced rates. Such a company was organized in Toronto recently with a capital of over a million dollars.

Civic Publicity: A New Profession in City Development

By B. L. C.

With the wave of publicity which has swept over Canada in the past two or three years, there has been created a new profession—that which embodies publicity promoters. The profitable way in which large cities have utilized the services of these men in publicity campaigns is herein set forth. Not alone has the work been confined to cities; provinces have also launched into it.

CIVIC PUBLICITY has come to be a recognized factor in the growth and expansion of urban centres of population from one end of Canada to the other. It is an instant indication of the progressive spirit when any city is able to tell the visitor and the outside world that it has a publicity commissioner, an industrial agent or a press service bureau.

This is an entirely new department which has grown up within the past few years in the administration of municipal affairs. Where formerly, we were wont to get along with our finance, public works, fire, water and light committees, we must now have an industrial branch, or a joint committee of the City Council or Board of Trade. The publicity committee is likewise coming to be no small spending department.

Demand and Supply.

In this sphere of municipal government we see the rise of a new profession—a profession that pays salaries commensurate with the importance of the work performed. The fond father of the olden days who considered law or medicine the only professional outlet for his talented son will think twice before sending his boy into fields already overcrowded, when an inviting avenue looms up before his eyes and he sees the magic sign: "Civic Publicity."

L. T. McDONALD,
Industrial Commissioner, Regina.

H. W. BAKER,
Industrial Commissioner, Ottawa.

"Civic Publicity."

Brainy, energetic publicity experts experts can find a position any place they desire to hang up their hats. The demand far exceeds the supply. The man who can produce results can almost name his own price.

Origination of Movement.

The publicity movement gained its first impetus in the middle west and then developed with remarkable strides to the extreme limits on both sides of the continent. It is hard to say just where the idea first broke loose.

Fort William was long known as a milling centre; that is, it was known and recognized as such by every place else except by Port Arthur, its nearest neighbor. These two rival cities at the head of the Great Lakes were supremely happy when they were indulging in the pleasant pastime of heaving bricks at each other. One day, Fort William emerged with a triumphant chortle over the engagement of a publicity commissioner at a salary that left Port Arthur in a dazed condition. This new official happened to be one, H. W. Baker, who had seen service in some of the large cities of the United States, but had been attracted to civic publicity work as a promising field for early development.

The advantages of Fort William were soon emblazoned in a manner that resulted in a very perceptible increase in the city's population, and there was an industrial stimulus that benefited everybody.

Ottawa, the beautiful Capital nestling up there among the Laurentian hills that make the Ottawa Valley a region of constant delight to tourists and those fortunate enough to have their residence in that district, decided, three or four years ago that it should join in the publicity procession or be left in the industrial lurch. About a score of active members of the Ottawa Board of Trade met one evening, talked things over and came to the conclusion to launch a publicity campaign that would make the other cities gape with astonishment and display a deep sea green of civic envy.

After a canvas had been made of the merchants and manufacturers, it was found that every one of them stood in favor of convincing Canada and the world at large that Ottawa was more than a National Capital and a peaceful home for civil servants.

The publicity movement spread over the city like wildfire. It was talked from the hustings during the munici-

H. M. MARSH,
Industrial Commissioner, Hamilton.

pal election; in fact it was the most popular subject any candidate could include in the course of his remarks. The upshot was that Ottawa opened an industrial bureau, secured H. W. Baker from Fort William, as commissioner in charge, and has since been spending $15,000 a year, one-third of this sum being raised by Board of Trade subscriptions, and the other two-thirds coming from the civic coffers for a stated period under special legislation.

Montreal, the Metropolis of Canada, was content for a time to pursue the even tenor of her way and maintain her commanding lead in handling the commerce of the Dominion. The conservative element looked askance at any movement with a view to the inauguration of publicity for a city with over half a million population; but the march of progress was not to be arrested, and so we have in Montreal the Press Service Bureau, which has been organized "for the purpose of setting forth in a systematic manner by articles and advertisements the possibilities of the city with a view to attracting trade, commerce, capital and tourist traffic to Montreal in particular, and the Dominion in general."

K. S. FENWICK,
Industrial Commissioner, Quebec.

Newspaper Men in Request.

The development of the science of civic publicity is working havoc with the ranks of the newspaper men. Calgary is paying a handsome salary, something like $4,000 a year, to Mr. Andrew Miller, formerly managing editor of the Ottawa Free Press, and a journalistic worker in Toronto for several years. Mr. Miller naturally believes in printer's ink, but he also employs what he calls "the gumshoe" method, which consists of quietly slipping away to New York or some other city and arguing out in person that Calgary is the only city on the Canadian map worth while bothering with. Rival publicity commissioners have to admit that Mr. Miller's method is a winner, as they have found out to their own disappointment.

F. Maclure Sclanders, Commissioner of the Board of Trade at Saskatoon, is another newspaper graduate. He has led an adventurous career, having been twice around the world since leaving Glasgow, his native city. He works along original lines and gets results, because Saskatoon is growing and booming in true western style.

Arthur S. Barnstead, the secretary of industries and immigration for Nova Scotia, is a college graduate who took a law course and subsequently became editor-in-chief of the Acadian Recorder, the oldest newspaper in Nova Scotia. This bureau spends $20,000 a year, of which one-quarter goes for salaries.

Take Mr. J. Grant Henderson, who decided to transfer his allegiance from the Ambitious City that boasts of its famous mountain to the Forest City that boasts of the River Thames—excepting when it overflows in the spring of the year. He is another publicity worker who enjoyed a long experience with the newspaper profession. He is a Hamilton man, born and bred there, but London made him such a generous proposal that he could not resist, and when the change was announced there was criticism over a stingy policy that let such a well qualified man get away to a rival city. He recently resigned the London appointment.

It is only three years ago that Hamilton Council made the appointment of an industrial commissioner who would devote his entire time to this office, and in the intervening period over twenty large industries have located in that city.

London business men took a spurt recently in the publicity line, and besides engaging the services of Mr. Henderson, raised the sum of $100,000 to be invested in new industries locating in that city that require the assistance of local capital.

The Board of Trade in Brantford has raised $3,000 a year in subscriptions for the next three years as an annual appropriation for an industrial bureau to be established there.

For the past year or two Windsor has shown surprising industrial development, credited to the work of Charles L. Barker, Publicity Commissioner, and the joint industrial committee of the Board of Trade and City Council.

Winnipeg a Pioneer.

The city of Winnipeg was one of the pioneers in the publicity movement. A wonderful success has been achieved there, due to perfection of organization and the resourceful methods adopted by Charles F. Roland, the Industrial Commisioner, who is paid $5,000 a year in salary, and has almost unlimited resources at his command for handling the work. The city grant in 1906 was $1,500. It has been increased nearly a scorefold, as the grant was $25,000 in 1911.

Elliot S. Rowe, a native of Whitby, has been called the Ambulating Ad. for Vancouver. He is a teacher, preacher, lecturer, investigator and informant, but principally and mostly he is the official publicity purveyor for the metropolis of British Columbia.

Cities are not the only municipal corporations that have a monopoly of this new science of booming some particular community. The county councils are awakening to the importance of the work. During the past two years Lambton, Norfolk and Essex counties in Ontario have been placed on the honor roll, with the principal object of attracting settlers from Michigan, Ohio, Illinois, and Indiana, and from the Old Country, in addition to promoting the "Stay-in-Ontario" campaign.

CHAS. S. HOTCHKISS,
Industrial Commissioner, Edmonton.

◆

H. M. Marsh, Commissioner of Industries for Hamilton, Ont., was for fifteen years connected with the Hamilton Cotton Co., during which time he managed several departments. He was appointed Commissioner of Industries on May 1, 1912.

Canada's Automobile Market and Manufacturing Prospects

By Chas. L. Barker*

The automobile and motor vehicle are here to stay, and concerning them, there may be said as of the telephone, it seems hard to realize how commerce and industry got along previous to their advent. Canada, as will be noted, appreciates the utility of both types of machine, and little wonder is it that a disposition to manufacture for both home and foreign consumption is largely in evidence.

As an indication of the extensive market existing in Canada for automobiles, it might be cited that the biggest item in the list of imports from the United States for 1912 was that of automobiles, the amount being $8,858,694.

The automobile industry in Canada has scarcely emerged from the infancy stage. Up until a year ago, the trade has been largely supplied by firms in the neighboring Republic. Eighty per cent. of imported automobiles came from the United States, only three per cent. from Britain and less than two per cent. from France and other European countries. The remaining percentage were of Canadian manufacture. It is not anticipated, however, that the imports will continue in these proportions. New automobile industries are being established on the Canadian side, and, naturally these firms will draw the cream of the business in the future. There is preponderating evidence that Canadians, who for the most part prefer "Made-in-Canada" goods, show a decided liking, when it comes to automobiles, for American makes. European cars are rarely found in any of the Provinces of the Dominion.

Statistical Records.

The Trade and Commerce Department at Ottawa reports that there were 3,488 automobiles imported in 1911 and 6,020 in 1912, showing that the trade almost doubled in one year.

The value of autos and motor vehicles imported in 1911 was $4,235,196, while the duty paid on same amounted to $1,443,898. The value of automobile parts imported in 1911 was $522,223, and the duty paid was $179,889.

For 1912 the value of imported automobiles was practically double that of the preceding year, and for this year it is estimated that Canadians paid out about three millions of dollars in duties on imported automobiles, nearly all of which were purchased in the United States. When we say "this year" we refer to the fiscal year ended March 31 last. Canada's ten-year tribute to the god of speed and convenience, through the automobile alone, is officially estimated at $118,000,000. During the past decade, despite the high cost of living, Canadians have paid out this enormous sum for the most modern achievement of the pleasure-loving age and the "get-there" era. The figures are based on the estimated sale in Canada of about 60,000 machines, at an average, say, of $2,000 each. This may be a trifle high, but an expenditure of a hundred millions seems well within the mark.

Canadian Plants.

The rapid development of the trade in Canada and its alluring possibilities have attracted a number of automobile firms from the United States, in order to take advantage of the 35 per cent. duty. In addition, there are a number of what might be called purely Canadian automobile companies, who are doing a splendid business because they know the trade conditions, and also for the reason they turn out high-grade and reliable products.

CHAS. L. BARKER,
Industrial Commissioner, London, Ont.

The Canadian census figures show only eight establishments engaged in the manufacture of automobiles and eleven in automobile repairs and accessories. Since these figures were compiled, several others have started up, mostly American Companies operating under Canadian charters and incorporation papers. For instance, there are now American branch industries in Canada turning out automobile castings, bodies, trimmings, tops, wheels, etc. The Kelsey Wheel Co., of Detroit, is building at Windsor, Ont., the largest automobile wheel plant in the whole British Empire.

The Ford Motor Co.

As an example of the growth of the automobile trade in the Dominion, it is violating no confidence to say that the Ford Motor Co. of Canada, turned out, approximately, 5,000 cars two years ago. Last year the output was about 10,000 machines. So far, this year, there have been 13,000 cars shipped, and there are orders, at this writing, for 3,000 more. The Ford Co. is the largest automobile firm in Canada, employing from 1,200 to 1,500 hands, and turning out as many as forty machines a day.

The development of the Ford business furnishes probably the greatest record made by any industrial firm in Canada. At the time the Canadian company was organized, about 1905, the stock went begging, and Mr. Gordon McGregor, the present managing director, almost despaired of raising the required capital. He finally succeeded, however, and organized a company with $125,000 capital. The first dividend was 6 per cent. Then for two years no dividends were declared. The business, after that began to show signs of prosperity, and a ten per cent. dividend was followed by hundred per cent. cash return for the stockholders in 1910. The same dividend was paid for 1911. In 1912 the capital was increased to a million dollars under a Dominion charter, there being a distribution of six shares of new stock for one of the old, and later a bonus of two more shares, making eight to one share in the old company. The cash dividend was at the rate of 120 per cent. for the year.

By reason of their location, opposite the city of Detroit, which is the automobile centre for the United States, Windsor, Walkerville and Ford City have become the manufacturing centre for the automobile trade in Canada. The E. M. F. Co., now known as the Studebaker Corporation, with an estimated output of 5,000 cars per year, the Hupmobile Co., the Gramm Motor Truck Co., the Canadian Commercial Motor Co., the Tate Electrics, Ltd., Fisher Body Co., Dominion Stamping Co., Kelsey Wheel Co., American Auto Top Co., American Auto Trimming Co. and R. C. H. or Hupp-Yeats are some of the more important industries in the Windsor, Walkerville and Ford City district.

When we mention the Russell Motor Car Co., Tudhope, McLaughlin, Keeton, Brockville, etc., the reader will understand that the industry extends to other important towns and cities in Ontario.

That there is an expanding market in

---

*Industrial Commissioner, Windsor, Ont.

Canada. no one will attempt to deny, for the medium and higher-priced cars, and also for the manufacture of autos for export. Nearly all of the automobile firms in Canada are doing a large business in export trade, by reason of favorable tariff arrangements with foreign countries, but more especially those in the British Empire, which can hardly be called "foreign," in the accepted sense of the term, to Canadians and Canadian manufacturers. Without making any particular effort to cater to the Canadian trade, the makers of the higher-priced cars in the United States have enjoyed a fine record of sales to Canadian buyers. Unofficial returns, but from a reliable source, are that the Cadillacs sold in Canada last year numbered about 500. There were possibly 350 Overlands, 200 Packards, 200 Chalmers and 100 Loziers. It seems safe to say that the year 1913 will see an output of 30,000 cars in Canada, and the total may run even beyond that. Over 20,000 of these cars will be of purely Canadian manufacture.

What of the future? With the tremendous immigration that is flowing into the country and its unexampled prosperity and rapid development, it is easy to believe that the output for next year will be 40,000 cars—perhaps 50,000.

"Canada is practically a virgin field for the automobile industry," declared a well-known authority, who follows the auto shows in various cities throughout Canada and the United States and knows conditions perfectly. "There is absolutely no sign yet of over-production, and no danger of that so long as Canada goes ahead the way it has done the past few years."

Observations Relative to Getting New Industries

The data forming the subject matter of this article is equally applicable to any municipality, and because of its sound reasoning and clear-cutness, should be laid to heart by the citizens and administrators of every Canadian town and city, in order that they approach the industrial question from a proper standpoint.

ON the occasion of his appointment as Commissioner of Commerce and Manufacture for the town of Lethbridge, Alta., Joseph P. Tracy was tendered a complimentary banquet by the citizens, at which he delivered an address. His observations on the subject of getting new industries to a city are interesting. He said in part:—

Expansion in Manufacture.

During the last ten years especially, there has been a general seeking after factories. All progressive cities have awakened to the importance of this policy, and much knowledge gained by experience is available on the subject. I would not venture to say that factory establishment has developed into a science, an art, a profession or a craft; however, several general tendencies in location and growth have been manifested to those studying the subject.

Under my observation, new manufacturing enterprise most often arises out of a community itself. Not many factories worth having will migrate. There are exceptions, of course, but they are rare. Some communities have sought to rob other places of their factories. The consequences following such efforts have generally compared with those results that follow other forms of stealing. An industrial policy should follow legitimate lines. As in other spheres the human element is the most important in manufacturing. Capable management is even more important than cheap materials, adequate capital, or good transportation. The manufacturer is a man. Man has dominion over all the resources and creatures of the earth, and, Godlike, he can make choice of his location, and assemble what he needs and what he pleases.

The first suggestion to manufacture probably comes to the consumer and the distributor. In the ordinary course of life, they observe or perceive the necessity or opportunity for making something.

A genius is found to invent.

An executive is found to superintend.

Materials are found assembled and processed.

Salesmen are employed to sell, and lo, we have a factory.

These conditions may arise in Lethbridge. Indeed, with so many of our needs now supplied from other localities, with so many resources at hand, and with so many liberal inducements offered by the municipality and such a favorable market in sight, I shall expect embryonic factories to bud on every hand—from the students, from the merchants, from the craftsmen, and indeed from anywhere.

A Natural Policy.

There is a diversity of gifts in our human nature that is interesting in this connection. For example, with a piece of metal in hand, one may produce a watch, another a stove, another a gun, another a rail, another a ship, another a sword, another a plowshare, another a spear, another a pruning hook.

With a bit of silica sand, one may produce a window, another a bottle, another a vase, another a marble, another a sidewalk, another a stone.

My thought then is to arouse those who have gifts to an appreciation of the opportunities for the exercise of their gifts in Lethbridge, and the first natural expectation is that those who have already undertaken the manufacture of anything in Lethbridge will expand and enlarge their enterprises as far as they can safely and profitably do so. To these we offer hearty support.

The next natural expectation is that those who live in this locality and incline to manufacture anything or who have capital to invest will first undertake their enterprise in Lethbridge. To these we offer sincere assistance.

The next natural expectation is that those of other localities who may consider the establishment of manufacturing elsewhere will be attracted by a capable and systematic presentation of manufacture to be found in Lethbridge. the advantages and inducements for These will be searched for, and earnestly and honestly dealt with.

Now, these three expectations may all be lively at the same time. I simply put them in the natural order, and from my sense of the situation, I believe a generous whole-hearted co-operation along the lines suggested will result in making Lethbridge a city of renown.

In conclusion I will express my policy and my desires in three short words—ALL JOIN HANDS.

◆

HIRING A STREET SYSTEM TO CELEBRATE.

THE entire street car system of Calgary was hired by the Hudson Bay Co. on the afternoon of Monday, August 18, the day on which their mammoth new Calgary store was formally opened by the Hon. G. H. Bulyea, Lieutenant-Governor of Alberta.

Arrangements were made whereby the sixty-five cars of the Municipal Street Railway System were owned by the Hudson Bay Co. for four hours on that day, and the entire population of Calgary were invited to ride free between the hours of 2 and 6 o'clock in the afternoon. Every citizen who took the street car to and from the opening ceremonies was thus the guest of the great company.

It is not known what the Hudson Bay Co. agreed to pay the City of Calgary for the privilege of owning sixty-five street cars for half a day, but it must be a large sum, as the Calgary Municipal Railway does an enormous business and pays very high returns.

Cheaper Fuel, Saskatchewan's Industrial Problem

The results of the investigations carried out with a view to determining the value of lignite as a fuel for power generation and general industrial purposes, are highly encouraging, and give indication that the handicap under which the Province now labors with regard to the establishment of factories, is a near future removal possibility.

THE extraordinary growth of the Province of Saskatchewan calls for cheaper power and cheaper fuel, and this matter has been under consideration, both publicly and privately, for a very long time. The government having decided to make an appropriation of $3,000 in order to obtain a report on the subject of producing power at the mines and distributing it throughout the Province, the matter was given to A. J. McPherson, chairman of the Board of Highway Commissioners, who secured R. O. Wynne-Roberts to undertake the work. The latter gentdleman immmediately started to collect data as to what fuel was available, and in what manner it was being consumed. He entered into correspondence with authorities in all parts of the world, so as to obtain the best information on the subject, and his report has now been handed in.

Cheaper Fuel a Necessity.

It will be apparent to the reader that the real development of Saskatchewan will in a large measure be dependent on the supply of cheaper fuel and power than is now available. At present about half a million tons of imported coal is being brought into the Province from Western Canada and the United States, and about 200,000 tons are being mined in the neighborhood of Estevan. About half of this goes to Manitoba towns; consequently the consumption of coal in the Province amounts to about 600,000 tons, of which only 17 per cent. is of local production. Imported American coal costs anything from $8 to $13 per ton, and when it is borne in mind that the prosperity of the Eastern States of America is due to the low cost of fuel (for instance, it only costs $1 per ton in Pittsburg), it is clear that industries are not possible without causing the production to be too high in price to compete with the imported article.

What is Lignite.

What is lignite? To understand what lignite is we must start with peat, which is the result of the decomposition of vegetable tissue in water when free from contact with air. Vegetation which is now found in swamps each year dies and fresh growth develops. In course of time the accumulation of vegetable matter assumes considerable thickness. Peat ranges in character from brown fibrous and friable matter to almost black carbonaceous matter. The next step in coal formation forms lignite which under pressure of superincumbent earth deposited through subsequent geological ages has been compressed, preserving in many cases its vegetable structure. In other cases, however, it is devoid of all signs of vegetation, when it is difficult to define the difference between it and bituminous coal. These two fuels belong to what geologists call the recent fossil age. The next kind of coal to be formed is bituminous, and finally we get the oldest coal, which is anthracite.

Question of Fuel Values.

The next question is the value of these fuels for general use. Peat is used in many countries as domestic fuel and for the development of power, but as it usually contains from 80 to 90 per cent. of water, it has to be air dried before it can be used with any degree of efficiency. Lignite also is used in some countries to a very great extent; for instance Germany consumes eighty million tons per annum, and some of the German and Austrian cities use more lignite than any other kind of fuel. Up to the present the quantity of lignite used in North America is comparatively small, which is due to the fact that there is abundance of cheap bituminous coal, but of late years more attention has been directed towards the use of lignite.

Location of Lignite Fields.

According to the Canadian Geological Survey Reports, there is a large field of lignite extending southwards from Moose Jaw to Estevan in one direction, and westwards to Wood Mountain in the other. The area is of a triangular shape, and is reputed to contain 15,000 million tons. This figure, however, is undoubtedly conservative, as wells have been sunk near Estevan in which several layers of lignite have been found to a depth of 600 feet. There is another lignite field in Saskatchewan, which lies along the Alberta boundary commmencing with a line drawn from Maple Creek towards Saskatoon, and back to the Alberta boundary north of Macklin. This also contains a very large amount of lignite, but has unfortunately not been prospected to the same extent as the southern field.

Lignite for Power Generation.

Lignite is being used to generate power at the flour mills in Saskatchewan and Manitoba, on occasions at the electrical plants in Regina and Moose Jaw, and in connection with gas producers at Rouleau and Swift Current. Owing to the absence of reliable information as to the results obtained in consuming lignite for power generation, Mr. Wynne-Roberts and the conthority of Mr. McPherson and the consent of Mr. Carpenter, Deputy Minister of Public Works, asked Mr. R. N. Blackburn, Wh. Sch., chief inspector of steam boilers, to undertake scientific and practical tests. These tests were made at Estevan and Weyburn. Full particulars are given in the report, but it may here be pointed out that the net heating power obtained in steam power was only about 50 per cent. of that contained in the coal. In ordinary practice 70 per cent. is recognized to be good, and Mr. Wynne-Roberts in his report points out that if 70 per cent. of heat value is worth, say, $100, fifty per cent. efficiency is only worth $70, so that there is a loss of $30 in every hundred. Information has been received showing that 70 per cent. efficiency has been secured with lignite in some German plants. It is therefore evident that it is worth an effort and some expenditure to secure better efficiency.

Lignite for Gas Producers.

The Canadian Government carried out some tests at the McGill University in 1908, both with steam power and gas producers. The United States Bureau of Mines also carried out a large number of tests at St. Louis and at Pittsburg. There are a large number of ber of tests at St. Louis and at Pittsburg. There are a large number of plants in actual operation in Texas, which by the way is the largest consumer of lignite in North America. The average results of all these tests demonstrate that it is quite possible to develope one brake horse power by means of gas producers and engines for the consumption of about three pounds of lignite, but to obtain the same power by steam it is necessary to consume about three times as much. It is therefore apparent that lignite is better adapted for use in gas producers than in steam boilers.

Lignite for Gas Manufacture.

Another use made of lignite is in the manufacture of gas in large quantity. Many experiments have shown the possibility of making gas from lignite suitable for general use. This is done by means of the ordinary gas works plant, but the coke residue from the coal cannot without treatment be utilized. It can, however, be made into briquettes and excellent fuel is by this means to be obtained. Experiments have also been made in this direction in Texas; Ann Arbor, Mich.; at St. Louis, Mo.; at Speccia, Italy, and at Teplitz, Austria, which are confirmed by the results obtained in North Dakota.

Cheaper Power From Lignite.

There is no doubt that by adopting suitable appliances for consuming lignite it can be used for the development of power. Lignite being so different from coal in that it contains so much volatile matter and water and much less carbon it must evidently be used in a different manner. The Germans have evolved special furnaces for this fuel to raise steam, and they have adapted a number of gas producers for gasifying the lignite. This aspect of the use of lignite is set forth in the report in a chapter of great length. Mr. Wynne-Roberts has submitted several schemes for the generation of power at large central power stations located at the lignite mines, with copious figures showing the estimated cost of installing and working the same. These estimates are based on the first instalment of 10,000 h.p. It is, of course, impossible to review these figures here, but the general results indicate that it is quite possible to develop and transmit power to a large number of our towns at a rate much below what now obtains.

In these investigations Mr. Wynne-Roberts was assited by Mr. C. C. Cronk, and by Mr. L. W. Wynne-Roberts, B. Sc. Eng., London.

◆

MUNICIPAL BREVITIES.

Guelph, Ont., claims to be the first Canadian Municipality to operate all its public utilities successfully.

Thorold, Ont., has secured $3,000,000 worth of new industries in the last eight months.

Ottawa, Ont., has 192 important industries of various kinds, giving employment to 18,500 persons, with an annual pay roll of $8,500,000.

Lethbridge, Alta., has a population of nearly 20,000, and is the third city in Alberta.

Three Rivers, Que.—The Canada Iron Corporation recently spent $300,000 in enlarging their plant here.

Edmonton, Alta., in 1901 had a population of 3,167; it has now 53,611.

Winnipeg, Man., has 368 factories operating, employing 20,000 hands, with a capital of $43,000,000 invested.

Weyburn, Sask., 10 years ago, was not on the map; its population is now estimated at 5,345.

Welland, Ont., has every trunk line in Canada, seven in all, passing through the corporation limits.

Yorkton, Sask., has a machine shop, a flour and oat-meal mill, a sash and door factory, two brick yards, and a cement works.

Woodstock, Ont., is on the Hydro-Electric Power Commission line,.

Prince Albert, Sask., is developing hydro-electric power from La Colle Falls, twenty miles away.

Sherbrooke, Que., industries include iron, scales, boilers, jewelry, woollen goods, tobacco, medicine.

North Battleford, Sask., population has jumped from 1,877 in 1910 to 6,000 in 1913.

Hamilton, Ont., in the last ten years has secured twenty million dollars in plant values from American manufacturers.

Wilkie, Sask., Board of Trade is negotiating with the C. P. R. for the purchase of land to be used for industrial sites.

Fredericton, N.B. sells industrial sites at $1,000 an acre, but will give them away when occasion demands.

Three Rivers, Que.—An electric railway has been projected to connect all towns in the vicinity of Three Rivers, Que.

The Selkirk Development Co., Ltd., is a quasi-municipal enterprise organized for the purpose of assisting new industries with locations in Selkirk, Man.

Melfort, Sask., is installing sewerage, water and electric light plants, to be finished in September.

Owen Sound requires industries to employ female help, of which it has an abundance.

Nanaimo, B. C., has the largest coal mines in British Columbia.

Windsor Ont., is the centre of the automobile business for Canada, occupying the same position here as Detroit does in the United States.

One of Hamilton's claims for success is that the consuming population lies within what it calls "short delivery distances."

Port Arthur claims to have 3,000,000,000 tons of iron ore within a radius of 150 miles.

Hamilton, Ont. gets its electricity from large power companies generating at Decew and Niagara Falls, 35 and 42 miles distant respectively.

Weyburn, Sask. gives electric power to industrial concerns operating regularly at least five hours per night at power rates.

Calgary, Alta., supplies power to all industries at absolute cost, which ranges from one cent per kilowatt hour down to three-quarters of a cent, according to the amount used.

Prince Albert, Sask.—When the dam at La Colle Falls is completed, Prince Albert will be able to supply 13,000 h.p. for industrial purposes at a cost not exceeding $25 per h.p. per annum.

Woodstock, Ont. sells hydro-electric power for motors aggregating over 100 h.p. at $32.40 per h.p. per annum.

Welland, Ont.—Electrical energy to the amount of half a million horsepower is developed within twelve miles of Welland, by four competing companies.

Windsor, Ont., will shortly have power from the Ontario Hydro-Electric Commission. At present it is supplied by a private company.

Yorkton, Sask. owns its electric light and power plant, and makes special rates for manufacturers.

Brantford, Ont., has an unlimited supply of natural gas which is supplied to factories at 35 cents.

Port Colborne, Ont. can supply electric power at $16 per year, or at a regular meter rate of one and a quarter cents per k.w.

London, Ont. supplies hydro-electric power at $24, but a $4 reduction is promised.

Owen Sound, Ont., owns an electric light plant and a gas plant.

Trenton, Ont. has two dams within its corporate bounds, one of which is harnessed, generating 5,000 h.p. The other will shortly be developing 6,000 h.p. A 24 hour service can be supplied to manufacturers as low as $12.

Selkirk, Man. gets its power from The Winnipeg Electric Railway Co., and claims to have the lowest rates in Western Canada.

Three Rivers, Que.—The Shawinigan Water and Power Co. and the North Shore Power Co. are both within easy distance of Three Rivers, to which they supply power.

Fredericton, N.B.—The rates for electric power in Fredericton, vary from 2.7 cents to 9 cents per k.w., and the average charge at present is 5 cents.

The Trade and Industries of British Columbia Cities[*]

By Consul General D. F. Wilber

There is contained in this article an exhaustive statement of the present industrial achievements of Canada's Pacific Coast Province, together with observations covering the immediate and near future outlook, due to developments arising from the opening of the Panama Canal and the increasing prosperity of the Dominion generally.

VANCOUVER.

THE City of Vancouver is situated on Burrard Inlet and was incorporated in 1886. It has an area of 16.89 square miles and a present estimated population of 125,000. It has exceptionally good shipping facilities, is connected with foreign ports by a number of large steamship lines, and has a large tonnage in local shipping. Until 10 years ago the Canadian Pacific Railway Steamship Co. was the only line that carried on trade between Vancouver and the Orient. A number of other lines now share this trade.

Eight large steamship lines are making this place a principal port of call, not taking into account the many tramp steamers, sailing vessels and the local shipping. With the opening of the Panama Canal, a number of others will be added to this number, as well as increased facilities for handling the trade by the present lines.

Harbor Improvements.

While as yet nothing definite has been accomplished in the way of harbor improvements for Vancouver that can properly be credited to preparation for the canal business, a number of projects are under way that will materially assist in the handling of it. The dredging of the channel of False Creek will allow additional room for local shipping, and thus assist the probable congestion on the main water front. The improvement and completion of the several transcontinental railway lines will add to the transportation facilities for the removal of freight. The proposed Government wharf, which, if constructed, will be of re-inforced concrete, will extend into Burrard Inlet between 850 and 1,000 feet, with at least three sheds for freight and passenger accommodation of the latest type, costing $1,500,000, with four tracks running to the end of the dock, one of which will run along the edge in order that cargo can be unloaded from the vessels direct into the cars.

VICTORIA, B.C., INNER HARBOR, SHOWING DOCKS OF CANADIAN PACIFIC RAILWAY AND G.T.P. RAILWAY.

Steamship Lines.

The following lines are at present running into Vancouver; Canadian Pacific Railway Steamship Co., in the Oriental trade; the Canadian-Australian Line, operating between Vancouver and Australian ports; the Blue Funnel Line and the Royal Mail Steam Packet Co., running from European ports via India and the Orient; Harrison Line direct and the East Asiatic Co., from European ports via the Straits of Magellan; the Maple Leaf Line, running between eastern United States ports and Vancouver; and the proposed entrance of the Hamburg-American Line on the opening of the Canal. In addition to the above, there are a number of lines running in the local trade, such as the Canadian Pacific Railway Steamship Co., between Vancouver, Northern British Columbia and Alaska; the Grand Trunk Pacific Steamship Co. and the Union Steamship Co., running between Vancouver and Northern British Columbia ports; Pacific Coast Steamship Co., running between Vancouver and San Francisco; and a large shipping in local boats, tugs, tramp steamers, and sailing vessels, carrying lumber and ore from British Columbia and bringing various products to its ports. Among these are the oil steamers from California, and the sugar steamers from the Orient, South America, and the West Indies.

1912 Tonnage.

The following table shows the inward and outward tonnage from this port during 1912:

	Inward.		Outward.	
	Vessels	Tonnage	Vessels	Tonnage
Deep water ..	2,420	2,031,943	2,305	2,025.715
Coasting trade	8,237	3,205,067	8,623	3,449,620
Total	10,657	5.237,010	10,928	5,475,335

American Trade With Vancouver.

There is probably no city of the size of Vancouver where there are the opportunities for the advancement of American trade, owing to its recent establishment and the rapid growth of the city and Province. There is a large sale for building material and also an excellent field for American manufactures. While the British manufacturer has an advantage by reason of the preferential tariff, the American manufacturer has an equal advantage in a great number of cases on account of being closer to the market and the natural demand for a class of goods that a large percentage of the population is accustomed to, and with which the remaining portion of the population is gradually becoming familiar.

Real Estate.

Vancouver's real estate is valued at $138,557,595. and the number of building permits taken out during 1912 was 3,199, valued at $19,388,422, an increase of nearly $1,500,000 over 1911. The following table shows the different classes of buildings covered by these permits:

---

[*] Recent Consular report issued by the Bureau of Foreign and Domestic Commerce, Washington, D.C.

Buildings.	No. of Permits.	Value of Property.
Offices and stores.........	305	$7,341,554
Factories and warehouses..	216	1,746,582
Dwelling houses	2,222	3,929,993
Apart. and room. houses..	215	5,830,805
Repairs and miscellaneous	241	539,488
Total	3,199	$19,388,422

Assessment Statement.

The following table shows the steady increase of assessment in the city during the past ten years:

Year.	Real property.	Improvements.	Total assessable property.
1903	$ 13,845,565	$ 9,091,270	$ 22,936,835
1905	16,739,640	11,804,250	28,543,890
1907	38,346,335	16,381,475	54,727,810
1909	48,281,330	24,445,210	72,686,540
1910	76,927,720	29,644,755	106,572,475
1911	98,720,345	37,858,260	136,578,605
1912	138,437,610	54,064,165	192,501,775
1913	144,753,220	68,223,205	212,976,425

Indications are that the building permits will not be as numerous in 1913 as during 1912. The money market is very tight, and there is difficulty in securing loans from the banks except on exceptionally good security other than real property.

Business during 1912 was on the whole very satisfactory, but owing to the tightness of the money market and real estate speculation, the prospects for the coming year are not so good for business in general lines. A great many people who have purchased real estate on long-time agreements are finding it difficult to meet their payments as they come due, and it is expected that real estate values will be materially reduced during the next two years. While a number of large building operations are under way or financed which are necessary to carry out, it is thought that there will be a lull in construction work until conditions are more settled.

Revenue and Expenditure.

The revenue of the City of Vancouver for the year 1912 amounted to $4,008,762 as against $3,013,930 in 1911. The expenditure of the city for 1912 amounted to $11,440,390. The excess of expenditure over revenue is accounted for by the numerous undertakings inaugurated by the city during the year in order to keep pace with the rapid development. This is an increase over the expenditure of 1911 of $3,519,175.

The city's borrowing-power limit for 1913 is $32,908,078, an increase over the borrowing power of 1912 of about $12,000,000. The city's debt amounted to $21,314,363. Adding to this the amount of the proposed by-law covering the estimates for 1913, which amounts to $5,112,800, making a total of $26,201,565, leaves a net borrowing limit for 1913 of $543,484,354 in 1911.

Banking—Sewerage.

There are 60 banks, including branches, situated in Vancouver, and the combined clearings during 1912 amounted to $650,118,887, as against 543,484,354 in 1911.

There is at present a proposed joint sewerage system contemplated covering Vancouver and the different municipalities in the neighborhood of Burrard Inlet, such as South Vancouver, Point Grey, Barnaby, etc. The plant contemplates the construction of a trunk sewer throughout what is known as Greater Vancouver, covering a period of about 40 years. At present borings are being made in order to ascertain the proper locations, kind of materials, and approximate cost.

This sewerage system, which includes New Westminster, covers an area of 55,600 acres. The average rainfall during the past seven years was 56 inches and the average number of wet days 174. The estimated population of the area is 182,000. At present about 6,000 acres are more or less efficiently sewered, although there is no standard basis for design of construction. The estimated cost of construction is $5,500,000 for the first five years, and a similar amount for the following 25 years. The cost of construction will be divided among the different municipalities.

Industries of Vancouver.

Vancouver has 167 manufacturing concerns, employing 9,000 persons, with an annual pay roll of $5,669,000, a total output of $15,727,000, and a total investment of $23,000,000, not including real estate in a number of cases.

The allied timber industry—lumber, shingles, planing mills, sash and door factories, etc.—is the largest single line of manufacturing in Vancouver. These employ more than 4,000 men, with a pay roll of $2,375,000, represent an investment of $9,000,000, amounting to nearly one-half of the industrial business of the city, and have an output of $6,000,000.

There are nine furniture factories in the city, employing about 375 men, with a pay roll of $247,000, with an annual production of $910,000, representing an investment of $500,000.

Next to the timber industry comes the machinery and sheet-metal works of the city. They number some 15 establishments and employ in the neighborhood of 1,000 men with a pay roll of $690,000, an output of $1,800,000, and an investment of some $2,000,000.

The building and repair of small boats is an industry of importance and one that will show a rapid increase as the shipping of the port develops with the opening of the Panama Canal. At present there are seven of these establishments, employing 300 men with a pay roll of $400,000 and an output of about $1,000,000.

The manufacture of bread, cake, and confectionery is of considerable importance. Some 300 persons are employed with a pay roll of $150,000. The annual output is estimated to be $750,000 and about $1,000,000 is invested in the industry.

Printing and bookbinding manufacturers employ 490 persons with a pay roll of about $500,000, an annual production of $2,000,000, and an investment of $1,700,000.

There is one large sugar-refining establishment in the city, which furnishes practically the entire Province with its supply of sugar. Its raw product is brought from different points, such as Java, West Indies, South America, Japan, etc.

There are numerous other classes of manufacturers, such as footwear, clothing, brooms, bricks, cigars, paper and wooden boxes, wire fencing, gas mantles, stained glass, terra-cotta and wooden pipe, canned fruit, etc.

SOUTH VANCOUVER.

SOUTH VANCOUVER is the largest municipality in the vicinity of Vancouver, and is the third largest in the Province according to population, being exceeded by Vancouver and Victoria. It adjoins Vancouver on the south, and is, in fact, in all but its government a part of Vancouver. It has an area of 9,200 acres and an estimated population of 35,000. The population is scattered over the entire municipality, being heaviest along the lines of the street railways that connect it with Vancouver. It is entirely a residential city, and enables the working classes of Vancouver to secure more moderate rentals and home sites. It is only a question of a short time when this municipality, with a number of others in the vicinity, will be added to Vancouver, making a city with a population of 175,000. Its assessable property is valued at about $40,000,000 and its building permits for 1912 amounted to 2,626, valued at $2,635,451.

NORTH VANCOUVER.

NORTH VANCOUVER is situated across Burrard Inlet from Vancouver, a distance of 2½ miles, and is connected by ferry having a 20-minute service. It has a population of 9,000. On the completion of a proposed bridge across what is known as the Second Narrows, which will connect it with Vancouver, its importance will be greatly increased. The ferry, which is owned by the municipality, carried a total 3,304,599 passengers during 1912. The building permits for 1912 amounted to 432, valued at $541,000, and for the entire district about $1,000,000. It is expected that the Pacific & Great Eastern Railway will enter Vancouver by way of North Vancouver, which will have a considerable bearing on the future development of the city and district.

WEST VANCOUVER.

WEST VANCOUVER is one of the newer municipalities, and is situated across Burrard Inlet immediately west of North Vancouver, and was originally a part of that district. Its scenic possibilities as a residential city are at present its principal asset, although its harbor facilities are of great value as well, but on account of being situated so close to Vancouver and North Vancouver, and on account of its size, by reason of its recent incorporation, it will in all probability fail to secure the shipping of the port. At present the city is expending the sum of $250,000 for the construction of an 80-foot marine drive along its entire water front. Its assessment value of the property for 1912 amounted to $4,211,000, as against $1,864,000 in 1911. Its present handicap is the lack of proper transportation facilities with Vancouver. The ferry connecting it with Vancouver carried 90,000 passengers during the last six months of 1912.

POINT GREY.

POINT GREY adjoins Vancouver on its southeastern boundary. It has a population of between 6,000 and 7,000, and an area of 12,000 acres. At the time of its incorporation in 1908, its population was only 150. It is entirely a residential city, and has had a very rapid growth on account of its advantages as a residential place for Vancouver business men. An important factor in connection with its future development is the establishment of the British Columbia University, which will entail a large expenditure of money for buildings and land.

NEW WESTMINSTER.

NEW WESTMINSTER is Vancouver's second largest neighboring city, and has a population of some 20,000. It is located about 15 miles from Vancouver on the Fraser River. The river at this point has a depth of water rarely less than 30 or 40 feet at the wharves, and ocean vessels of 24 feet draft are loaded at this port. Heretofore the sands at the mouth of the river have interfered with navigation. The Dominion Government has already expended some $200,000 in clearing this channel, and will spend in the near future about $800,000 on the same project. Three hundred thousand dollars have also been expended in the purchase of an improved dredge for keeping the channel clear as well as deepening it. It is an excellent harbor, and owing to the fresh water is free from teredos.

There are 11 banks and 65 industrial plants. Its building permits for 1912 amounted to $1,634,528 as against $1,124,587 in 1911. Its total assets are $6,344,008, a surplus over liabilities of $949,302. The Great Northern Railway, Canadian Northern Railway, and Canadian Pacific Railway run through the city and the British Columbia Electric Railway connects it with Vancouver; running two lines in order to handle the traffic. A large harbor project is at present under way, some $500,000 having already been expended on the work.

The annual industrial output of the city amounts to $7,267,520, the pay roll totaling $2,145,840, and the number of employees 2,175, of which about four-fifths are white. These figures do not include the Fraser lumber mills, situated just outside of the limits of the city. The annual output of these mills is 150,000,000 feet, valued at $2,500,000; 1,100 men are employed. The fishing trade is of importance, as some $50,000 worth of halibut is shipped from the Columbia cold storage plant annually, and from 50,000 to 300,000 cases of salmon are canned at the mouth of the Fraser River. The importance of New Westminster is increased by the trade from the numerous smaller towns and municipalities that surround it at distances varying from 5 to 20 miles.

BURNABY.

BURNABY is situated on the Fraser River adjacent to Vancouver, about half-way between that place and New Westminster. It has an area of about 38 square miles, and is at present principally a residential place similar to Point Grey. The building permits and assessments for 1912 amounted to $1,312,850 and $20,576,205, respectively. It has a deep-water sea frontage of 6 miles and a deep-water river frontage of 4¼ miles.

PORT MOODY.

PORT MOODY is at the head of Burrard Inlet, some 12 miles east of Vancouver, at the statutory western terminus of the Canadian Pacific Railway system, and has an estimated population of 1,500 people. It expects to benefit materially from the growth of Vancouver, particularly from the fact that the growth is of a necessity in an easterly direction.

NEWPORT.

NEWPORT, situated on Howe Sound, about 100 miles from Vancouver, on the line of the Pacific and Great Eastern Railway, in a section rich in mineral, agricultural, and timber resources, was at one time the terminus of the local road, the Howe Sound and Northern Railway, recently taken over by the Pacific and Great Eastern Railway. There is at present a question as to whether this road will use Newport or North Vancouver as its terminus, but in all probability, on account of its nearness to Vancouver, North Vancouver will be selected. Newport has an excellent harbor, and will in time be a salt water terminal of some importance, whether or not the railroad uses it for that purpose. Lumber mills are in operation there, and what is considered a valuable clay deposit has recently been discovered and will be an important addition to the manufacturing possibilities of the place. It has considerable undeveloped water power near by that could be utilized for manufacturing purposes.

BELLA COOLA.

BELLA COOLA, situated about 350 miles north of Vancouver and 200 miles south of Prince Rupert, on the head of Burke Channel, is practically the first good harbor north of Vancouver. It is the starting point of the Pacific and Hudson Bay Railway, which will open up that section of British Columbia between the Pacific Great Eastern Railway and the Grand Trunk Pacific Railway. While it is little more than a settlement at the present time its possibilities are very great. There are vast mineral, timber, and agricultural resources lying back of the coast in its vicinity. It has been estimated in recent provincial reports that the port of Bella Coola has a larger acreage subsidiary to it than other British Columbia port.

PRINCE RUPERT.

THE first work of establishing what is at present the city of Prince Rupert was undertaken by the Grand Trunk Pacific Railway during the summer of 1906, prior to which time there was no settlement of any kind, not even an Indian village. The city is situated at the mouth of the Skeena River, opposite Dixon Entrance, within 30 miles of the southern boundary of Alaska and about 540 miles north of Vancouver, and now has a population of 5,000. As the Western terminal of the Grand Trunk Pacific Railway and with a landlocked harbor some 8 miles in width it will, no doubt, become a port of great importance in the future. At least 20 per cent. of the inhabitants are American and their property interests in the city and surrounding country are large.

The total assessed valuation of the

town site plotted is $19,500,000, and there remain large quantities of land to be sold by the railway company and the Provincial Government. Although the Grand Trunk Pacific Railway will not be completed for another year, the port last year had a tonnage arrival of 273,044, comprising 279 vessels. Of these, 123, with a tonnage of 101,031, were from the United States. Two American vessels make weekly calls from Seattle, and there are also 2 Grand Trunk Pacific Railway Co., 2 Canadian Pacific Railway Co., and 2 Union Steamship Co. vessels calling there weekly from Vancouver. In addition to this, there are a number of freight vessels carrying supplies for the railroad. The estimated exports from Prince Rupert for 1912 and 1911 were $64,344 and $33,948, respectively, and the imports for the same period were $614,269 and $500,721, respectively.

The fishing industry is being rapidly developed in this vicinity, there being at present one of the largest cold storage plants on the Pacific Coast located there. In addition, other concerns are making preparations for the expected increase of this industry. The return of salmon from the Skeena River district amounted to 222,035 cases in 1910, 254,410 cases in 1911, and 254,258 cases in 1912.

There is at present under construction by the Dominion Government and the Grand Trunk Pacific Railway a floating dry dock that will cost on completion in the neighborhood of $2,000,000, and the Grand Trunk Pacific Railway intends erecting in the near future a $1,000,000 hotel as well at their terminal station.

On the completion of this road, Prince Rupert will benefit greatly by the westward movement of grain for shipment through the Panama Canal and to the Orient, and the eastward movement of the products of the fishing and timber industry. There are also vast deposits of coal, copper, silver-lead, gold, and other minerals, as well as large tracts of agricultural lands in the interior of British Columbia along the line of the railroad. Excellent prospects for oil and salt have also been found either in the vicinity of Prince Rupert or along the line of the road.

HAZELTON.

HAZELTON, originally a trading post, is situated on the line of the Grand Trunk Pacific Railway at the confluence of the Bulkeley and Skeena Rivers, and has a population of 800 or 900 at present, brought there owing to the construction of the road. The town is situated on the north shore of the river, and, as the railroad is on the south shore, the company has established a place known as South Hazelton. It is expected that upon the completion of the road, the population of Hazelton will move into the new city.

FORT GEORGE.

FORT GEORGE is one of British Columbia's latest northern cities. It is situated on the line of the Grand Trunk Pacific Railway at present under construction, at the junction of the Fraser and Nechaco Rivers, about 450 miles north of Vancouver, 459 miles east of Prince Rupert, and 461 miles west of Edmonton, Alberta. Like Hazelton, it was originally a trading post. The construction of the Grand Trunk Pacific Railway should reach this place from the eastern end by the end of 1913 and should be completed across the continent by 1914.

The proposed construction of the Edmonton, Dunvegan and British Columbia Railway from Edmonton to Fort George, and that of the Pacific and Hudson Bay Railway between Bella Coola, on the Pacific Coast and Fort George, and the completion of the Pacific and Great Eastern Railway between there and Vancouver will make Fort George an important railway centre for the surrounding district.

NELSON DISTRICT.

THE general business situation for the year 1912 in the Nelson district has been in practically a normal state. Generally speaking, all lines of trade and all the various industries have prospered, some perhaps more than others; yet on the whole the situation has been a healthful one and a general feeling throughout the district at the present time is one of prosperity and general advancement in all industries, and undoubtedly each will show a substantial increase over that of the preceding year.

Mineral Production.

Mining has been more active and the results more satisfactory than for some time past. The price of metals, particularly copper, has been such as to allow of mining and treating low-grade properties with a reasonable prospect of profit. In view of the present conditions quite a number of these low-grade properties are being developed, and in some cases large quantities of ore are being shipped. Large mining interests have acquired mines throughout the district either through option or purchase outright and are in many cases installing plants and making necessary preparations for the working of these mines on quite an extensive scale. Possibly 75 per cent. of all mining operations are carried on and financed by American capital, and the opinion seems to be quite universal that without this interest shown by Americans the mining industry would suffer. While a large proportion of the operating mines are yet in the development stage, there are a sufficient number of dividend payers to give encouragement and stimulus to the industry. Districts that appeared promising at the beginning of the year have proven satisfactory, and the indications are that they will develop properties greater than was anticipated.

Aside from the production of copper in the district, which exceeds that of all the other metals combined, the most advancement has been made in zinc properties. Recent discoveries for the treatment of zinc ores have been made by parties in the district, and experiments have advanced to such a state as to warrant the purchase of the Canadian rights by one of the largest smelters in the country. A plant is now being constructed to treat the zinc-bearing ores of the district by the new process.

For 1912 the paying mines have paid practically $1,250,000 in dividends, and this amount will doubtless be exceeded the coming year. The experiments in connection with the treating of platinum, which was discovered in this vicinity last year, are progressing, but at this time are not advanced sufficiently to warrant any extended report on the process or results.

The total mineral production of British Columbia for the past year was approximately $32,606,000, of which this district produced over one-half.

Lumber Industry—Fruit Growing.

The lumber industry on the whole has been a very successful one, although not up to the expectations early in the year. Mills and logging operations were active, and the production was a considerable increase over that of the preceding year. The demand for lumber from the prairie provinces has been good, but the greater portion has been supplied by American lumbermen, particularly in the cheaper grades. The local demand for building material of all kinds has been good, many buildings of various kinds having been erected in the city, and throughout the surrounding country.

The development of fruit orchards is naturally a slow process, and some 8 or 9 years are necessary before results can be expected. In this district there are many orchards now coming into bearing, and within a year or two many more will be producing, which will increase the output enormously. Plans are now being perfected for some practical method of handling and selling the orchard products, and it is expected that some system will be adopted to handle the crop for the coming year. More land is being cleared and prepared ready for planting trees, and while the acreage planted may not be as great as last year, the total will be considerable. There is a demand in the district for plants for the manufacture of jam, canning factories, and cider and vinegar works.

As the yield from orchards increases there will be large quantities of unsaleable fruit that can be worked up into goods of this class, and as at the present time this line of goods is shipped from the East in large quantities, there should be good openings for manufacturing plants of this nature. At the present time there are only two jam factories in the district, one operated by private enterprise and the other by the Doukhobor community. The Doukhobors, it is reported, are to erect a second and larger plant this year.

There are in this district about 4,000 Doukhobors, located in several communities or settlements, all practically under the leadership of one man, who transacts all the business. They have cleared large tracts of land, built sawmills, waterworks, bridges, roads, as well as a great number of houses for their members.

Development of the City.

Local conditions during the past year have been favorable for the development of the city, many large and substantial buildings have been erected in the business district, and also many residences in the residential part of the city. The Canadian Pacific Railway is planning extensive improvements in their yards and shops in this place, and a general improvement in their lines throughout the district. A large steamer is just being completed for their increased traffic, and a general betterment of the system in this district is apparent.

Export Statistics.

A large increase in the value of the exports to the United States over that of any year in the history of this office has taken place, due largely to the general increase in business in all lines and also to the fact that the year's work has been free from interruptions of all kinds. Indications for the coming year are favorable, and it is quite likely that another high mark will be set in most lines of business. As the principal exports of this district are mine products, the increased development of this industry was responsible for the increase in the exports. The following table gives the exports to the United States for 1911 and 1912:

Articles.	1911.	1912.
Blister copper	$3,960,277	$ 7,048,966
Copper matte	319,944	2,636,794
Coal	3,484	3,746
Cyanide	282	......
Cedar poles	8,819	7,038
Electrical supplies	710	......
Furs and hides	5,512	20,649
Fence posts	805	......
Gold concentrates	499,798	620,038
Gold bullion	173,486	134,738
Horses	2,247	835
Household goods	19,718	12,048
Logs	2,982	......
Lumber	5,826	2,992
Machinery	2,164	......
Miscellaneous	120	109
Railroad ties	4,563	3,270
Shingle bolts	540	......
Silver bullion	44,596	427,987
Zinc concentrates	143,852	237,434
Total exports	$5,199,675	$11,156,644
Returned Amer. goods..	69,717	30,125
Total	$5,269,392	$11,186,769

WHITE HORSE DISTRICT.

COPPER was the principal mineral mined in the White Horse district, and the ore was all shipped to the smelters at Tacoma, Wash. The shipments in 1912 amounted to 31,404 tons, valued at $229,840. The total value of all exports from this district to the United States was $234,170.

The reported discovery of a rich placer field 50 miles east of Lake Teslin has created considerable interest here and at outside points. Placer mining is being carried on in the Kluane and Livingstone districts on about the same scale as in previous years. Operators in the Kluane district are hopeful that a railroad will be constructed from Haines, Alaska, to the head of the Tanana River. Such a road would tap the longest and most continuously mineralized belt on the American Continent.

VICTORIA.

By Consul A. E. Smith.

THE growth of Victoria in the past five years has been remarkable, the population increasing in that time from 20,000 to 65,000. A great many new buildings have been completed, and many more are in course of completion, including a million-dollar courthouse. In 1912, 1,759 permits were issued involving the expenditure of $8,021,165, as against 1,201 permits involving $4,026,315 in 1911. The fire loss in 1912 was $49,742, as compared with $93,037 in 1911.

The exports to the United States from the Victoria consular district, including the agencies at Nanaimo and Cumberland, were as follows for the calendar years 1911 and 1912:

Articles.	1911.	1912.
Automobiles	$ 5,507	$ 6,712
Coal	1,547,344	3,364,771
Clams	3,192	11,769
Copper matte	683,552	......
Copper	......	16,822
Fertilizer	195,233	229,768
Fish	22,965	7,691
Furs	5,924	11,102
Hides	67,608	90,801
Horses	3,529	9,344
Household goods	24,089	33,407
Junk	11,709	8,391
Logs	130,322	171,636
Liquor	19,347	7,622
Shingles	13,269	11,104
Whale oil	252,917	307,872
Miscellaneous	41,592	24,439
Total	$3,028,099	$2,313,246
Returned Amer. goods..	93,539	176,966
Total	$3,121,638	$2,490,212

NANAIMO.

NANAIMO, with a population of 10,000, is the centre of the coal mining industry of the province. This industry is rapidly growing in magnitude. The lumber industry is also of great importance. When dredging operations are completed, the Nanaimo mills will be able to engage in the Australian and foreign trade, which is at present impossible owing to the lack of deep-sea shipping facilities. The manufacture of bricks bids fair to rival the lumber industry in importance. One company has a plant with a capacity of 20,000 bricks a day.

ESQUIMALT.

IMPROVEMENTS are now going on in the harbor of Esquimalt on the breakwater, and two piers of 1,000 feet in length are proposed, which, on completion, will give vessels 4,000 feet of dockage with a depth at low water of 35 feet.

As soon as arrangements can be made, the contract is to be let for building the railroad bridge to Hospital Point from Johnson Street, which will add 25 acres to the Songhees Reserve, besides making it a depth at low water of 35 feet for dockage. The Government appropriated $1,500,000 to advance that work.

It is understood that Parliament will be induced before the close of this session to provide for constructing a new Government-owned dry dock at Esquimalt 1,100 feet in length, modern in every respect, and divided to accommodate two smaller ships at any time. The estimated cost is $1,500,000.

IMPRESSIVE.

THE navy increases of Great Britain were rather impressively set forth in the estimates introduced in the House of Commons on July 17. "We are," it is explained, "due to receive a torpedo-boat destroyer on the average of one a week for the next nine months. During the next 12 months we shall receive on the average a light cruiser every 30 days, and during the next 18 months we shall on the average receive a super-Dreadnought of the latest possible type, and of the highest possible cost every 45 days." Incidentally, it is held that the age of oil firing has come, and that destroyers, cruisers and battleships are all being ordered for oil firing only.

Industries In Request by Many Canadian Towns and Cities

Staff Article

No attempt is made in this brief sketch to include even all of the more important towns or cities of the Dominion, rather, is it, by reference to the varied attractions of a few, to show that successful industrial enterprise has an unlimited scope within our borders.

THERE is not a city, town or village in Canada but is specially fitted for some particular industry, by reason of its raw products, its geographical position, power, or exceptional labor conditions. There are towns in the West, like Souris and Estevan, blessed with a choice supply of clay which makes exceptionally fine brick. Such towns are suited for brick-making industries.

Windsor, Ont., has the largest salt industry in Canada, and consequently is an ideal location for chemical works. By its nearness to Detroit, it becomes the Mecca for automobile industries. The United States Steel Corporation will provide another source of raw material in their big steel plant, which will attract subsidiary trades.

To determine what industries were being sought by various towns in Canada, we sent a circular letter to a number of municipalities, and the replies received are of considerable value because the industrial commissioners and secretaries of Boards of Trade have not exaggerated their claims, and in most instances have stated exactly what trades could find a suitable market in their districts.

Locations and Offerings.

Nanaimo, B. C.—From far-off Nanaimo, on Vancouver Island B.C., the Commissioner, H. G. Coleman, writes: "As Vancouver Island is only just being opened up, it is impossible for me to say what raw material we have. However, those which have been developed, include coal and timber, and prove conclusively that this Island has a bright future. Nanaimo has lumber mills, sash and door factories, box factories, breweries, cigar factories, powder works, etc. Population, 3,000."

Peterborough, Ont. claims a phenomenal increase in population—63 per cent. in ten years. Chief industries are, The Canadian General Electric Co., Quaker Oats Co., Brinton Carpet Co., Delaval Separator Co., Henry Hope & Sons, and the Vermont Marble Co. It is surrounded by an agricultural and dairy district. Population, 22,500.

North Battleford, Sask. is a new city; manufactures cigars, flour, brick, candy, and sashes and doors; is a distributing centre for harvesting machinery; makes complete reports on any industry, and assists new industries; on C. N. R. and G. T. P. Commissioner N. G. Neil. Civic electric light and water plants. Pop., 5,000.

Owen Sound, Ont., wants iron, white wear or knitting industries; plenty of female help; freight rates a dollar less than to inland towns; two railways and 4 steamship lines; civic light, water, gas and power plants. Population, 13,000.

Melfort, Sask., has opening for pork-packing plant, flour-mill, and brick plant; will be on Hudson Bay Railway; has government creamery; took 84 car lots of farm machinery in 1912; and 102 cars of lumber; on C. N. R.; water and electric light. Population. 1,522.

Trenton, Ont., seeks iron industries on account of an iron concentrating plant there. Raw materials—iron, graphite, galina, talc, marble, timber. Two paper mills near. Has 3 railroads, good harbor, and is on Trent canal, 100 miles from Toronto, and 235 from Montreal. Cheap electric power. Population, 5,000.

Selkirk, Man. is near Winnipeg. Will get Manitoba Rolling Mills, Manitoba Nut & Bolt Works, and a horse shoe plant. Connection by water with Lake Winnipeg. Civic light and power plant. The Selkirk Development Co. assists new industries.

Three Rivers, Que., has manufactures of pulp and paper, cotton, boots and shoes, iron, gloves, chairs, silver plating, sash and door, whitewear. There are five railways, daily steamship service to Montreal and Quebec; a splendid harbor, and plenty of cheap power. Population 18,000.

Fredericton, N.B., needs the following industries:—Foundries, steel plants, furniture factory, canning factory, tanneries, etc. Has river service, new wharf; is near Drummond iron mines; raw material from mines and forests also near. Industrial sites, $1.000 an acre; free water; private owned power plant; civic water plant. Population 14,500.

Sault Ste. Marie, Ont.—Abundance of raw material, including iron ore and lumber; land available for industrial sites. Present industries include steel plant of Algoma Steel Corporation. Low water freight rates for eight months of year; headquarters of Algoma Central and Hudson Bay Rly.; undeveloped water power; on the C. P. R. Population, (including Steelton), 18,500.

Prince Albert, Sask. seeks industries that can use natural resources such as clay, sand, building stone, timber, mixed farming products and ochre. Gives free sites, cheap power, and unlimited water. Owing to large lumbering, fishing and fur industries, has an ideal labor market. Population, 13,000.

Sherbrooke, Que.—City has options on sites near the railway. Industries include Canadian Ingersoll-Rand Ltd., E. & T. Fairbanks Co., Ltd., Sherbrooke Machinery Co., Paton Mfg. Co., the Jenckes Machine Co., Ltd. Raw materials—timber, brick, sand, iron and copper deposits, limestone. Eighty per cent. of the world's supply of asbestos is mined near Sherbrooke. Water power in unlimited quanitites is available for new industries from the Magog River. Railways—C.P.R., G.T.R., Q.C.R., and B. & M. Population, 18,000.

Acton, Ont. has opening for shoe factory, foundry, and machine shops; is near Toronto; and will encourage new industries. Existing factories include Beardmore Tanneries, Acton Tanning Co., and a glove factory: Hydro-electric power. Population, 2,000.

Wilkie, Sask., has openings for flour and oatmeal mill, sash and door factory, creamery, cement block plant, steam laundry, and light manufactures. Power and water plants. Negotiations progressing re industrial sites. Population, 2,000.

Woodstock, Ont.—Industries include Bain Wagon Co., Canada Furniture Manufactures Ltd., Whitelaw Foundry and Machine Co. Hydro-electric power; splendid railway facilities; free sites given, and fixed assessment. Population, 10,000.

Calgary, Alta., has special advantages for the manufacture of boots and shoes, bags, binder twine, brushes and brooms, condensed milk, furniture, farm machinery, gelatine products, lines, paints, stoves, straw paper, tanned leathers, clay products, flour milling and breakfast foods. Shipping facilities—C.P.R., G.T.P., and C.N.R. Provides exemption from taxation on plants employing over 25 hands. Industrial sites for sale at Manchester, 2½ miles out, at $1,200 per acre, including trackage. Hydro-electric power owned and distributed by city at $30 per h.p., natural gas, and plenty of water. Population, 78,000.

Weyburn, Sask., owns a large tract of land for industrial sites, served by spurs from the C.P.R. and G.T.P. Provision made for C.N.R. tracks. Present industries include flour mills, sash and door factory, creamery, foundry, brewery, brick and tile works. Power and light furnished by city. Weyburn would prove a favorable location for flax fibre mills, oatmeal mill, biscuit factory, oil mills, soap factory, twine and cordage mills, mattress factory, starch factory. There are good openings for boot factory, tanneries, carriage factory, wire fence and a furniture factory. Is opposed to a cash bonus or exemption from taxation. Free sites are offered. Population, 5,345.

Yorkton, Sask., has openings for straw hat or oil cake factories, as flax is grown extensively there. Has three railways. Warehouse and factory sites with open trackage, electric light for factories at cheap rates. Population, 4,550.

Hamilton, Ont. claims that manufacturers going there find a large percentage of their raw materials waiting for them. These include iron and steel castings, pig iron, bar iron, machine tools, wire, nails, screws. It has 400 industries, and a labor market supplied with the best type of skilled mechanics.

Guelph, Ont., has eighty manufacturing industries with a total capital of $8,500,000. It is 48 miles from Toronto, on the G.T.R. and C.P.R. Its tax rate per capita is very low. It will give free sites to manufacturers, cash bonuses, and cheap electric power. R. McDonald, Commissioner. Population, 18,500.

Edmonton, Alta. is looking for the following industries:—Boot and shoe, brush and broom, soap works, men's clothing, mittens, gloves, sweaters, hosiery, underwear, paper boxes and bottles, biscuit factory, stove works, builders' hardware, stepladders, washing machines, kitchen cabinets, drain pipe, pottery, lithographing, traction engines, farm tools, strawboard, flax fabric. Civic power, light and water. Industrial sites leased by city for 21 years. Raw materials are hides, grease, horn, hoofs, straw, flax fibre, wood, coal tar sands, clay, pulpwood, moulding sand. Population, 67,243.

Thorold, Ont. has a water front, Niagara electric power, railways, natural gas, cheap sites, and a long list of big industries including The Coniagas Reduction Co., The Ontario Paper Co., (plant cost $1,000,000), The Beaver Board Co., and Pilkington Bros., Ltd., glassmakers. James Battle, commissioner.

* * *

ST. JOHN, N.B.

ALTHOUGH the city of St. John made a much greater gain in the value of building permits issued during the first seven months of this year, compared with the like period last year, than any other city in Canada, there is still a scarcity of houses to accommodate the growing population. Secretary Hoag of the Board of Trade has been making enquiries and declares that the supply of houses for residential purposes is entirely inadequate to meet the needs of the city. Real estate men declare that only about 20 per cent. of the new houses that will be required this fall are now under construction. The population of the city is increasing, and has increased during the last year far more rapidly than accommodation has been provided for homes for the new arrivals.

The Banks and St. John.

The banks have faith in the forward movement in the city of St. John. The walls of the new bank of British North America are now rising, and the building which has been enlarged and is being completely remodelled for the Merchants' Bank of Canada is nearing completion. The Bank of Montreal has moved to the premises formerly occupied by the Bank of Nova Scotia, in order that its own building at the foot of King Street may be turned over to the architect and contractor from Montreal who will completely remodel the premises, giving the bank more room and providing it with the very latest in bank furnishings and equipment. It will take four or five months to complete the work.

The C.P.R. and St. John.

It is reported on what appears to be good authority that the Canadian Pacific Railway Co., has purchased a building on the corner of King and Germain Streets, and that when it has secured possession, the building will be remodelled and the various offices of the company, which are now located in three different buildings, brought together under one roof. The C. P. R. has just placed upon the Bay of Fundy route between St. John and Digby a 24 knot flyer, the St. George, brought out especially from the old country to provide part of a much faster service between Montreal and Halifax by this route. The company now has two steamers on the St. John and Digby route, giving a daily double service. During the last two years, the C. P. R. has enormously increased its investments at St. John, and it is paying more and more attention to the development of traffic by this route.

A VIEW OF THE WATER FRONT, ST. JOHN, N.B.

Steamship Service Revived.

The steamship service between St. John and ports on the South Shore of Nova Scotia, which has been suspended for a considerable period, has just been re-established. The steamer John L. Cann, with good passenger and freight accommodation, had gone on the route between St. John and Yarmouth, and will make connections there for ports on the south shore as far as Halifax.

The wholesale trade of St. John had built up a large business on the south shore, and the Board of Trade has been making vigorous efforts to have the steamer service renewed.

New Brunswick Coal.

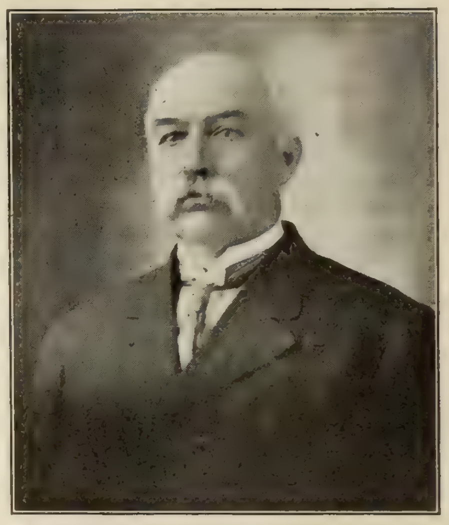
Although the permanent bridges on the new railway between Minto in the Queen's County coal fields and Fredericton have not yet been erected, temporary bridges are in use,and coal is daily being hauled over the line to Fredericton for use by the Canadian Pacific Railway. The Dominion Bridge Company has just begun placing the superstructures of the permanent bridges, and as soon as that is done and the rest of the work on the line completed, it will be operated by the C. P. R., and the output of coal from the mines greatly increased. The coal is of excellent quality for railroad use, and the C. P. R. itself will be a very important customer.

Evidences of Progress.

The work on the seven-story warehouse which is being erected for the McClary Manufacturing Co., on Water Street, below the Customs House, is being rapidly advanced. The walls of the first two stories are of concrete, and this is being surmounted by five stories of brick. Vassie & Co., Ltd., the dry goods firm who have secured a site and will erect a large warehouse beside that of the McClary Manufacturing Co., are applying for authority to increase their capital to $380,000. The Petrie Manufacturing Co., are also to erect a warehouse on Water Street. The city council has just given permission to have two railway tracks laid in Water St., so that these warehouses as well as those on the wharf on the other side of Water Street, may be better served for traffic purposes. The railway traffic in the south end of the city has grown so much that the city and the Intercolonial Railway are endeavoring to provide more accommodation for cars and are finding it difficult to secure the necessary space.

A Very Busy Year.

There has been no complaint in the Province of New Brunswick this year about scarcity of work for either mechanics or laborers. It has been a very busy year, so much so that when nine saw mills at St. John ceased operations because of a dispute about wages, the men found no difficulty in getting other work. There has never been a year there was less complaint on the score of inability to secure work by any class of men, than there has been thus far in the present year. When to this is added the fact that the farmers are gathering an excellent hay crop of good quality, and are promised a large yield of grain, roots and vegetables, and that the fishermen along the shores of the province have had a generally successful season, it will be seen that the industrial and commercial outlook in New Brunswick is excellent. It is worthy of note that the ready-made farm scheme is being worked out with success, and there is a gradual increase in the number of people taking up farms. The Provincial Department of Agriculture has decided to give special encouragement for the cultivation of alfalfa and excellent results are expected from this source.



R. McDONALD,
Industrial Commissioner, Guelph.

LIVELY LONDON.

DESPITE the universal financial stringency, London, Ont., is experiencing hitherto unprecedented activity, particularly in the erection of new buildings of almost every description. Reports of twenty-one of the larger cities of the Dominion's building permits for the first six months of the year now to hand, provide substantial evidence of London's progress in this direction, as compared with other cities. Only one Canadian city shows a larger percentage of increase over the first six months of 1912 than London. The amount expended in new buildings up to the end of June this year was $554,269 more than was put into new buildings during the same period last year. Only two Canadian cities can show a larger amount of increase in actual value of buildings during the same periods, while a few have to record a decrease in this year's building as against the same period last year. The total amount of the seven months ending July 31st is $1,192,554.

Falling in line with many ambitious cities of the continent, London is organizing a thoroughly representative body of the leading financial, commercial, industrial, professional and educational interests of the city, devoted to co-operative plans of civic improvement and publicity. The City Council and the Board of Trade are the moving spirits in the matter, while the hearty co-operation of many business bodies and firms is assured.

THE MUNICIPAL EDUCATIONAL PROVISION.

THE editorial pages of the present issue of Canadian Machinery are almost wholly devoted to data relative to acquirement by towns and cities throughout the length and breadth of our Dominion of industries which shall contribute to their growth and development, and incidentally add their quota to the development, wealth and well being of the country as a whole.

Hand in hand with industry in all lands, and, of course, more particularly in those of older and more mature civilization, there is and has been in varying degree, a more than ordinary effort put forth to provide for not only the educational uplift of the worker, but in addition, to show him how imperative it is from a personal, community and national point of view, that he take advantage of the opportunities offered and the facilities provided .

What strikes us as being lacking in communities in spite of the many other desirable features which appeal to manufacturers bent on locating a plant, is this all-important matter of education, commercial and technical, although, perhaps in a majority of cases, the latter may be that alone unprovided. We talk somewhat loosely, it would seem of skilled and unskilled labor, forgetting all the while that there is an efficiency achievable with the latter, of as much value commercially as with the former. Investigation relative to "Scientific Management" amply bears out our contention, therefore, whether the establishment of an industry means the employment of a proportionately high percentage of unskilled labor, so called, or otherwise, from the manufacturers point of view, if he is to succeed in his enterprise, a certain degree of intelligence must be forthcoming on the part of his employees, however, classified.

The work of an Industrial Commissioner and the Civic Board of a Municipality may not and does not cease with respect to an industry, immediately the Agreement for its location and establishment has been signed and sealed. The disposition to put it up to the proprietor or Board of Directors of an industry secured, to make the venture a success is both mean and unreasonable, and in many cases reacts with untoward effect on the community concerned at a later date. An added responsibility attaches to the ratepayers of a town or city indirectly, and directly to its rulers, which involves co-operative effort on their part, in spite of capacity for success inherent in and due to the personnel of the industry's management. Much may be done to enhance the success ,otherwise achievable, and in no feature will the effort put forth produce results equal to that of educational provision.

Every manufacturer realizes to-day, that intelligent application to his task, is needful on the part of the operative, in every capacity, if he, the employer, may meet fair competition on equal ground. The acquirement of intelligence is by way of education in some form or other, and instead of there being skilled and unskilled labor in our enterprises and undertakings, there really exists but the skilled feature, only in varying degree.

An ordinary common school or elementary commercial education provision is a requirement with which every municipality casting about for industries should be equipped, not only for the education of an operator's family, but for the operator himself if need be. Further, technical education should be kept well in the forefront of schemes propounded for the advancement and well being of a municipality and its citizens. Existing provision for technical education of employees, or prospects and facilities that may lend themselves to the establishment of courses of instruction in this direction, carry more weight with prospective manufacturers when seeking to locate a plant, than town and city officials generally realize, and where attractions are otherwise about equal, a blank is usually drawn by the municipality lacking this feature.

The Commission appointed to investigate and report on the subject of technical education for our people, made, in a preliminary statement published some few months ago, suggestion that ample and widespread assistance by way of grants be placed at the disposal of municipal and educational authorities, within whose bounds industrial enterprise was being propagated and encouraged.

May we hazard the opinion that industrial commissioners actively prosecute and bring to a successful outcome, their claims, to a share of the proposed expenditure on behalf of technical education, commensurate with their importance as a live industrial and generally progressive centre.

SELECTED MARKET QUOTATIONS

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, August 18, 1913.—While some houses report pretty fair business, others have found things rather quiet, and taken all round conditions are much the same as they were a week ago. There has been very little doing in the machinery line; but this is a not unusual state of affairs at this season of the year, and dealers look for considerable improvement by the end of September.

Pig Iron.

The pig iron market is fairly steady. Prices remain low, and, although Canadian foundry pig has advanced 50 cents per ton, at present prices furnaces are making very little money. Drummond, McCall & Co. No. 1 furnace at Midland has been closed down for the past four weeks owing to the present unremunerative prices ruling, and No. 2 furnace is only working on contracts placed several months ago.

Metals.

Copper remains steady for the present at last week's prices, but is likely to advance in the near future. Statistics just published show that the output of the Lake Superior district for July last was 38 per cent. lower than for the preceding month, and was the smallest monthly production in ten years. The main cause of the decrease was, of course, the strike which started towards the end of July. Spelter shows a slight decline, while tin and lead remain unchanged. Steel mills throughout the country are mostly working to approximately full capacity, and the dealers are now beginning to feel the benefit of the Dominion Iron and Steel Co. new rolling mill, which commenced operation last spring. Trade in old metals remains fairly brisk, and it is probable that the present low prices will remain in force for some weeks yet.

Toronto, Ont., August 19, 1913.—While business in machine tools is quiet, there are indications that engineering concerns see good business not far away. The Pollard Manufacturing Co., who a year ago purchased the old Niagara machine shop at Niagara Falls, Ont., and have since done a flourishing business in saws for cutting stone, have prepared plans for a new plant to be built in the fall. This will consist of a machine shop and a foundry. Up to the present this company has been working night and day, but has now pretty well caught up with its orders. The Canadian Fairbanks-Morse Co., Ltd., this week, supplied the Corporation of Chesley, Ont., with a 60 h.p. oil engine to run the waterworks plant. The pumps at Chesley have been in use five years. They were formerly run by a producer gas engine, which will now be used as an auxiliary. A. R. Williams & Co., dealers in machine tools, are expecting to do a big business during Fair Week. At the Toronto Exhibition they will show chiefly motor-driven tools. Special demonstrations will be given on a Warner & Swasey hollow hexagon turret lathe, just to show what this new type of lathe will do. The other large Toronto dealers will not exhibit tools, although the Canadian Fairbanks-Morse Co. are expected on the ground with a show of pumps and oil engines. The General Supply Co. of Adelaide Street, who do a large machine tool business, are sharing the slackness with other firms, yet report fair trade in supplies.

Steel.

The feeling in the market just now is that manufacturers are getting quite close to the time when they will be compelled to buy pig iron, bars, sheets, etc., to keep their businesses going. So far their aloofness has not resulted in any reduction of prices. Dealers are getting quite a lot of inquiries just now, chiefly from stove makers. Many manufacturers, however, have bought their sheets for the remainder of the year. It is expected that the demand for this commodity will be as heavy this fall as it was last year.

Metals.

A fair amount of business is being done in metals. The market is almost featureless this week. Tin has risen $2 a ton. In the old material market, heavy melting steel has gone up $2 a ton, owing mainly to supply and demand. Brass clippings and turnings and tea lead have gone up in price.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

North Sydney, N.S.—R. Musgrave has begun to build a new machine shop.

West Vancouver, B.C.—F. J. Peters, 837 Hastings Street, has plans for a new $20,000 garage and repair shops for D. S. McLaghian, Eburne, B.C.

North Vancouver, B.C.—The Canadian Pacific Railway Co. has purchased the Lonsdale Estate, on which it will erect shops, roundhouses, etc.

Bridgeburg, Ont.—The Tuttle & Bailey Mfg. Co., New York, makers of registers, ventilators, etc., who were reported to be erecting a plant at Bridgeburg, have not yet prepared plans.

Calgary, Alta.—The Government of Province of Alberta is erecting a garage to cost about $6,000. It will be one storey, 32 x 74 ft. M. Calder is superintendent Public Works Department.

Sydney Mines, N.S.—At the plant of the Nova Scotia Steel & Coal Co. a new 50-ton open-hearth furnace equipped with Blair patent water-cooled port ends is nearly completed. It will be supplied with gas by an installation of Crapman mechanical gas producers.

Dartmouth, N.S.—The Starr Manufacturing Co., Ltd., which for forty years has been a prime factor in the industrial life of Dartmouth, and whose output has made its way into all parts of the world, seems likely to soon give place to a new and greater concern—the Starr Iron and Steel Corporation, Ltd.

New Westminster, B.C.—The foundations, caps and joists of the new plant of Heaps Engineering Co., Ltd., are erected. The main building, 410 ft. long, by 90 ft. wide, is two-thirds finished. The outlay will considerably exceed $35,000. The new plant will be in operation in the fall.

Brantford, Ont.—Industrial Commissioner Emerson considers it very likely that the Coniagas Reduction Co. plant, which will be moved from Thorold, will locate in this city. A very attractive proposal has been made to have this big smelting company locate here. The company's plant, which will be thoroughly modern and up-to-date, will mean an outlay of about $250,000, and about one hundred and seventy-five men will be employed.

Port Colborne, Ont.—Extensive yards with roundhouse and machine shops are to be built here by the Grand Trunk Railway Co. N. Fergusson is superintendent of the construction department, Montreal.

Ottawa, Ont.—A. H. Coplan & Co., manufacturers of hard iron, semi-steel, brass, bronze and aluminum castings, are trying to get an exemption from the Council of Hull, Que., after which they will erect a new plant in that city.

Toronto, Ont.—Fire broke out in the building of the United Shoe Machinery Company's building at 122 Adelaide Street West, last week, resulting in a loss of $1,800—$300 to the building and $1,500 to the stock.

Fort William, Ont.—The Fort William Brass Foundry, which was recently destroyed by fire has been re-organized under the name of the Varlow Foundry Co., Ltd., with a capital of $40,000. The new plant is already in operation with a staff of fifteen brass molders. The prospects are bright.

Sorel, Que.—The Sorel Iron Works, Ltd., is moving its plant to Maisonneuve, Que., and will add to its present business of manufacturing boilers, engines, etc., a department to manufacture automobiles. The new name of the company will be Oxford Motor Cars & Foundries, Ltd.

Sarnia, Ont.—The Imperial Oil Company, the Canadian branch of the Standard Oil, has started the big job of razing many stills and other old machinery at its big plant here. For the past few years the business has developed very fast, and with the additio of the big pipe line from Toledo to Sarnia, the plant will be greatly increased. The old buildings are being torn down and will be replaced with more modern buildings and better machinery.

Electrical

Hull, Que.—The Ottawa & Hull Power Co. has started the erection of a large power house near the Chaudiere Falls.

Calgary, Alta.—The City Council is planning the erection of a power substation. George Craig, engineer.

Quebec, Que.—Workmen are at present being employed by the Dorchester Electric Co. to put up poles and wires for an electric light service into Charlesbourg. The village expects to have an efficient electric light system within the next two weeks.

Kamloops, B.C.—The Seattle branch of Chas. C. Moore & Co., engineers, has secured the contract for furnishing two 1,100 horse-power water wheels for the hydro-electric power plant to be constructed by this city. The Canadian General Electric Co. procured the contract for the switchboard and transformers and the Canadian Westinghouse Electric & Mfg. Co. the contract for the generators. Ducane & Dutcher, Vancouver, are the consulting engineers. Work will be done under direction of Charles C. Moore & Co.

Municipal

Watrous, Sask.—The town has sold $35,000 worth of debentures for waterworks and $35,000 for sewerage.

Souris, Man.—The ratepayers will decide on September 2, the question of raising $40,000 by way of debentures to provide cost of installing electric lights for the town.

New Westminster, B.C.—The city secured an option recently on the plant, mains charter and goodwill of the Westminster Gas Co. for sixty days. The price named in the option is $150,000, of which $20,000 is to be paid in cash and the balance of $130,000 in city debentures. The option was secured by Ald. J. B. Jardine, chairman of the gas committee, and Mayor Gray.

Macleod, Alta., has sold debentures amounting to $336,000, the proceeds to be used for improvement work as follows: For the construction of a sewerage disposal plant in connection with the sewerage system, $50,000; for the extension of the sewerage, $36,000; for the construction and extension of the municipal system of sewers, $23,000; for the construction of a filtration plant and the improvement and extension of the waterworks system, $81,000; for the construction and extension of the waterworks system and the extension and enlargement of the electric light system, $46,000; for the erection and equipping of a building to be used for municipal purposes, $100,000.

A Welcome Visitor

IN A CERTAIN thriving Western Ontario City there are three large machinery manufacturers. Their lines are known from one end of Canada to the other, and to think of their product is to think of the maximum in quality and efficiency.

¶ Last week our circulation representative paid a visit to the town in question and visited the offices of the three machinery manufacturers. He stated his mission to the manager of each. He explained that he was representing "Canadian Machinery and Manufacturing News," and desired to bring its merits to the attention of such of their foremen and chief mechanics as were not already subscribers.

¶ In reply to this request the manager of each concern not only allowed our representative in his shop, but sent an escort to introduce him to the very men he desired to meet.

¶ There's appreciation of a good thing for you.

¶ Each manager was familiar with "Canadian Machinery" because **each concern was an advertiser.** Each knew the value of our paper as a practical help to greater efficiency. They were willing to break an almost unalterable rule that no visitors be allowed inside their shops doors, in order that their men might be brought in touch with "Canadian Machinery," and have its merits explained by a man well qualified to do so.

¶ The example set by these three big concerns might well be followed by every machinery manufacturer and metal worker in the country. When our circulation man calls at your office or any other man's office he does so for the purpose of offering you a proposition it will pay you well to consider.

¶ If he asks permission to interview some of your leading mechanics it will be wisdom on your part to let him do so. If he can secure as readers of our paper your superintendent, and foremen mechanics, it means that their work will be more up-to-date, more profitable and that the result of their increased knowledge will be gradually transmitted to the rank and file of your whole mechanical organization.

¶ "Canadian Machinery" is a weekly journal published in the best interests of the machinery and metal-working trades of Canada. It is full of helpful information and will keep mechanical men in touch with developments in every branch of the field it covers.

¶ Any man who will read "Canadian Machinery" every week for one year will undoubtedly be a better workman and mechanic. His knowledge will be greater and his work more efficient.

¶ **It will pay you well to give our circulation man all the assistance you can when he calls on you again.** "Canadian Machinery is already represented in the best shops and factories in Canada, but twice a year our circulation men cover the ground in order to keep up with the natural growth of our industrial life. Changes are always taking place in every organization. New industries are constantly springing up and in order to keep in touch with developments our circulation men cover Canada thoroughly at least twice each year.

¶ That's one good reason why "Canadian Machinery" is a good advertising medium.

Rate Card and full information gladly furnished

Canadian Machinery & Manufacturing News

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.

143 University Avenue, TORONTO

General Industrial

Innisfree, Alta.—Robert Weder, Port Saskatchewan, will erect a flour mill to cost $18,000 here.

Moncton, N.B.—The J. A. Marven Co., 514-526 Main St., is having plans prepared for the erection of a biscuit factory, 60 x 260 ft., four stories.

Edmonton, Alta.—The Staince Co. will erect a four-story factory and warehouse, for the manufacture of iron beds, spring mattresses, etc.

Montreal, Que.—The Imperial Wire and Cable Co. have secured a building permit to erect a new eight-storey office building and factory in Montreal. The new building will be bounded by St. Patrick, Shearer and Richardson Streets and will cost $1,500,000.

New Elevator for Sarnia.—The Grand Trunk Railway is making preparations for building a large grain elevator at Sarnia, Ont., to replace the one destroyed by fire this summer. The new building will be considerably larger than its predecessor, and will be thoroughly equipped for the rapid handling of grain. The structure will be of reinforced concrete and steel, and will be absolutely fire-proof.

Orillia, Ont.—At a conference of the Town Council and Messrs, Cummings and Wilson of the C. N. & W. Shoe Company, the site of the new shoe factory was decided on. The factory will be built on Colborne street, just opposite the Tudhope Carriage Company's building. The Town has purchased two lots there, 130 feet in width by 150 feet deep. The C. N. & W. Co. is to have 80 feet frontage as free site, and an option on the balance.

Moose Jaw, Sask.—Negotiations are under way by which Moose Jaw may have a big factory for the purpose of manufacturing wheat and grain drying bins. George F. Brown, general manager of a company which is engaged in the manufacture of a new drying bin and which is operating extensively through the United States, states that he will consult W. B. Willoughby, and several other interested citizens, with the view to moving a big factory into the city.

The City of Windsor adheres to a standard policy of tax exemptions, free water and free light for new industries employing 25 hands or more. This plan, with city-owned factory district tapped by terminal railway, connecting with five trunk lines, and affording unsurpassed transportation facilities, has been a potent factor in the city's industrial development, which has been very marked during the past two or three years.

Refrigeration

The Arctic Ice Machine Co., Ohio, have recently booked the following orders:—St. Regis Hotel, Winnipeg, 1 ten-ton refrigerating machine for hotel use; St. Charles Hotel, Winnipeg, 1 ten-ton refrigerating machine for hotel use.

Waterworks

Dundas, Ont.—The council are considering installing a pumping and filtration plant.

Lovette, Que.—This town will instal a fire protection system. It will get a $2,500 grant from the Government. The waterworks system will also be extended.

Coquitlam, B.C.—The work of the past four years, that of preparing for and constructing the 75-foot dam at the head of Coquitlam Lake by the Vancouver Power Co., is nearing completion.

Ottawa, Ont.—Following a recommendation from the waterworks committee, the city council has voted $57,000 for lifting, repairing and relaying the old intake pipe, and the tender of Loomis, McBean and Williams, Montreal, being the lowest, this firm was awarded the contract.

Wood-Working

White Rock, B.C.—The Campbell River Lumber Co. is erecting a large sawmill here.

Eburne, B.C.—Joseph Parker, formerly president and general manager of the Parker-Bell Lumber Co., Seattle, is erecting a large shingle mill here.

Montreal, Que.—The planing mills owned by the F. Tremblay Lumber Co. and situated between William and Ottawa Streets at the corner of Guy, were gutted by fire shortly after midnight on August 15. The mills are situated in the middle of one of the largest lumber areas in the city. The lower end of the Northern Electric Co. factory is on the opposite side of Guy Street. The damage is not definitely estimated, but is roughly assessed at about fifty thousand dollars.

New Incorporations

Girard & Godin, Ltd., Three Rivers, Que., has been incorporated with a capital stock of $10,000 by Henry J. Elliott, Charles J. E. Charbonneau and others to manufacture automobile bodies, coaches and carriages.

James S. Elliott & Son, Ltd., Prescott, Ont., has been incorporated with a capital stock of $10,000 by H. J. Elliott and others to manufacture caskets, coaches, carriages and automobile bodies.

The Autographic Register Co. of Canada, Ltd., incorporated at Ottawa, capital $150,000, to manufacture and deal in autographic registers, supplies, etc., at Montreal. Incorporators: Cecil J. Swaim, Joseph Swaim, etc., Montreal.

Tool Hardening by Gas

The use of the gas furnace for forging, tempering and hardening steel is gaining ground among the workshops where cutlery and tools are made. The old "hearths" are disappearing, replaced by small, clean gas furnaces, which are not only economical in space and cost of running, and comparatively clean and neat, but furnish a uniform temperature of any desired heat, thus avoiding damage to the steel through "burning" or irregularity of temperature. We handle tool hardening furnaces.

SECOND HAND MACHINERY FOR SALE

JUST AS YOU were attracted by the Caption "Second Hand Machinery for Sale," so will hundreds of other men all over Canada.

WHY NOT ADVERTISE that machine of yours that is getting too small or that isn't quite suited to the work for which it was intended?

Let "CANADIAN MACHINERY" find a buyer for your machinery or let it find you a second hand machine if you need one. Let "CANADIAN MACHINERY" connect you with good men if you are looking for them or with a better job if you desrve one.

Let it sell for you or buy for you, be it a factory or a machine, a man or a job.

"CANADIAN MACHINERY" is the Market Place for Machinery and Metal Men. Come to it if you wish to buy or sell.

Rates for a stand in the Market Place are 2c per word first insertion, 1c per word each subsequent insertion. Each figure counts as one word.

Personal

W. A. Casey has been appointed municipal engineer at Esquimalt, B.C.

Douglas J. Peake, for many years an engineer in the employ of James Oakes & Co., a British engineering concern, has been engaged by the Canada Iron Corporation, Three Rivers, Que.

Geo. E. Graham, assistant superintendent of the British Columbia division of the C. P. R., has resigned to take up the position of general manager of the Coquitlam Terminal Company.

William Storrie, formerly waterworks engineer at Ottawa, Ont., has joined the staff of the John M. Ver Mehr Machinery Co., builders of the Ransome municipal filters.

M. H. Foley and J. W. Stewart, of Foley, Welch & Stewart, were visiting in Ottawa recently. Both have had several conferences with Premier Borden and Hon. F. Cochrane on matters of Western railway construction. Mr. Stewart, who has just returned from his newly purchased estate in Sutherlandshire, absolutely denies that he has any ambition to enter British politics, as recently reported by cable, but it is known among his friends here that he has been offered a knighthood and a seat for a Scottish division at Westminster.

Trade Gossip

The B. F. Sturtevant Co., of Canada, Ltd., has removed from its principal office from 304 University Street, Montreal, to 919 New Birks Building, Montreal.

The Smart-Turner Machine Co., Hamilton, Ont., report having recently received the following orders: The Canadian Porcelain Co., Hamilton, one automatic feed pump and receiver; E. D. Smith & Son, Winona, Ont., one Duplex pump; Corporation of St. Catharines, Ont., one Duplex pump; National Steel Car Co., one Duplex pump; The Donnacona Paper Co., Donnaconna, Que., one Duplex pump; Canadian Steel Foun-

Catalogues

The Canadian Allis-Chalmers, Ltd., have issued a bulletin describing the "Squires" steam trap for which they are the selling agents. Sectional views are given showing the patent double valve mechanism together with a complete description covering the design and method of operation. Tables giving the capacity of each size are included. Copies of the bulletin will be gladly mailed on request.

The Cleveland Planer Works, Cleveland, Ohio, have sent us a catalog descriptive of the "Cleveland" open side planers. The planers are made in several sizes, illustrations showing the principal features of each being given, together with a brief specification and a clear description covering the general design. Copies of this catalog will be sent to interested readers.

Book Reviews

The Department of Mines of the Dominion Government has published a monograph on the nickel industry which will be specially interesting owing to the fact that the International Geological Congress has recently been held in Toronto. The monograph is the result of investigations conducted by G. P. Coleman Ph.D., director of the Geological Department, Toronto University, in the Sudbury nickel region, on behalf of the Canadian Government. A complete description is given of the Canadian Copper Co.'s plant and property at Copper Cliff, Ont., and other plants in that district together with many interesting photographs and maps. Much valuable information is given of the nickel industry both from a geological and mechanical standpoint. The publication also contains descriptions of well-known plants in other parts of the world.

FILE
EFFICIENCY IS
MAN
EFFICIENCY

NICHOLSON-MADE files are sharp-toothed and fast-cutting tools. Each file at 15, 20, or 25-cent cost maintains the efficiency of costly skilled labor, and speeds production by that labor.

In each factory there is a point at which it pays to substitute a perfectly new file for one used some time, sometimes a period of only a few hours. When you ascertain this period for your factory, the best of all files are Nicholson-made Brands. Issue them—they are uniform, hand-tested, made in special steel, by private machines, and hardened by a special process. At all jobbers.

"Nicholson-made" File Brands:
American, Arcade, Great Western,
Globe, Kearney & Foot.

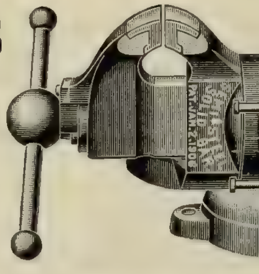
PARKER'S

Double Swivel

VISE

Saves Time



It can be swiveled on base or turned in barrel without opening the jaws, and is held in position by a turn of the tightening studs. All these vises have a solid steel bar strengthener, also solid under portion of front jaw. The faces are made of the Best Tool Steel, and are removable and renewable at time.

Do Your Stools Break?

Have You Replacing Expenses?

The trouble with the ordinary stool is the constant expense of replacing because they break so easily.

Our stools are practically indestructible and help to keep expenses down. They are just as neat in appearance as other stools plus the lifetime service and economy.

We make Wire Guards for all purposes. Tool Room Partitions.

Send a post card for full particulars and descriptions.

A Chuck For Every Purpose

Look Over This Complete List

Iron Body Indpendent Chucks, Steel Body Independent Chucks, Face Plate Jaws (Iron and Steel), Boring Mill Jaws (Iron and Steel), Geared Screw Chucks (Universal and Combination), Universal and Independent Two-Jaw Chucks, Geared Scroll Chucks, Drill Chucks, Planer Chucks.

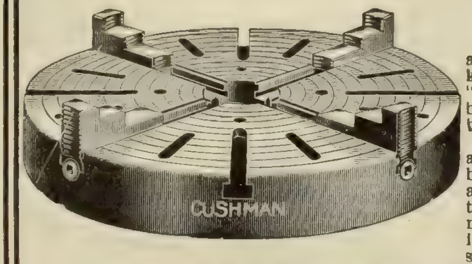
Morrow Drill Chuck

It pays to send your inquiry to a manufacturer who is familiar with all types. You not only get better advice and explanations as to comparative features but often we can save initial cost by advising a lower priced chuck that will do the work.

New Face Plate Jaws

Write for our 48-Page Condensed Catalog—full of distinct specifications and details, or ask regarding delivery and special service in the Dominion.

E. Horton & Son Company, Windsor Locks, Conn.



"CUSHMAN" CHUCKS

are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks and Face-Plate Jaws.

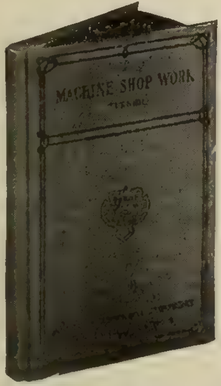
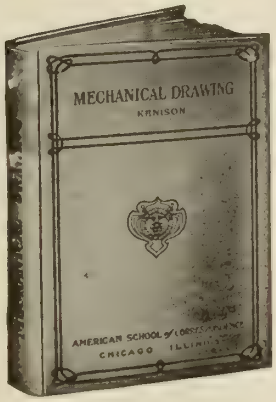
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

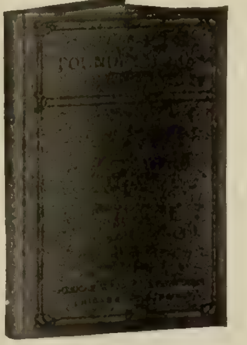


MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

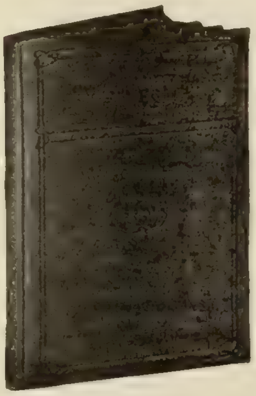


MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00



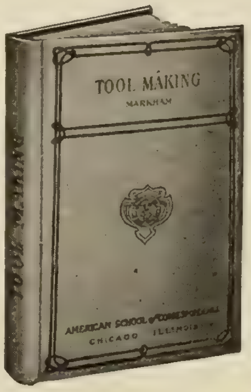
PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00



MACHINE DESIGN
GRIFFIN

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50



FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

Who Wants Your Order?

¶ The firms that are most likely to appreciate your order are the ones that are keenest to get it.

¶ The firms that advertise are bidding for your business in a broad, yet personal way,—the modern way. They are proud of their goods and are not ashamed to show them in public to the most critical.

¶ Patronize the firms that advertise. Consult this directory of machinery manufacturers and supply houses and you will connect with good concerns.

¶ A firm that appreciates your order will serve you well.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

A Valuable New Book on an Important Trade

PATTERN-MAKING

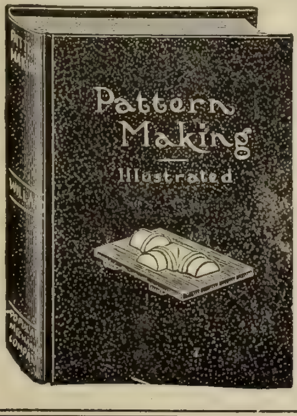
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

Chapter Headings

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

Part II.—Core-Making and Molding.

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

Long Service is a Natural Result of The "Twisted-While-Hot" Process

It must be annoying to the average drill user to have drills made from well known brands of steel fall down on the job. He wants efficiency and can secure it by adopting "Hercules" High Speed Drills.

"Hercules" High Speed Twist Drills

are made from a High Percentage Vanadium High Speed Steel under the only "twisted-while-hot" process that retains all the strength of the steel in the finished drill. The grain of the steel is undisturbed, insuring longer edge-holding and greater resistance to the strains of the metals having different degrees of hardness.
The taper shanks, usually one size larger than ordinary, prevent tang troubles and give a greater driving power because the drill fits into the chuck firmly and in the centre.
Your jobber will supply them or you can send order direct. Send for Catalog No. 82-G.

Have You Work Requiring Perfectly Parallel Surfaces?

The swiveling ram head on the

P. & W. VERTICAL SHAPER

will enable you to finish the job complete without changing the original setting and with a high degree of accuracy.

Here's the Way the Vertical Shaper Handles Square or Parallel Work

The ram head is set in the most advantageous position for the first side to be machined and is then firmly clamped. After finishing this side the head is swiveled through 90 degrees or 180 degrees, as the case may be. The table is then fed in the proper direction, the machine being provided with automatic quick-acting feeds. By this method of swiveling the tool instead of the work the accuracy of the parallel or square sides does not depend upon the setting of the table, but on the alignment of the machine. On long, awkward jobs this method is especially convenient.

Write for illustrated circular "Vertical Shaper."

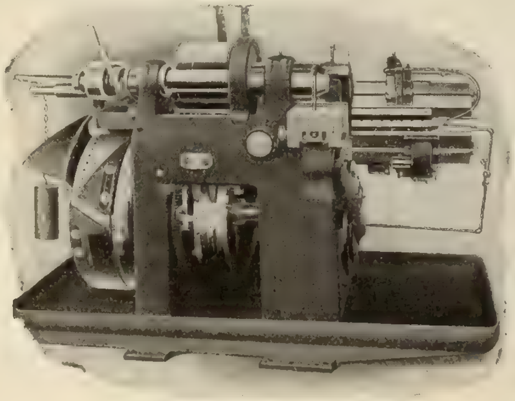
MONTREAL COBALT NELSON VANCOUVER

A Saving of Time and the Production of Accurate Work is Always the Result of Using

Gridley Automatics

As one operator can attend to several machines at once, and can use tools tandem on each machine when rapid production is necessary. On all other automatics there is an overhang of the tool. This overhang prevents the performance of accurate work, because the method of supporting tools does not permit as heavy cuts or as coarse feeds.



"GRIDLEY" Single Spindle

The Gridley is not an ordinary automatic, because in addition to handling any bar of metal within its capacity that can be made on any automatic, it handles work of greater length and of more complex character than other machines of this kind.
A complete investigation will prove of great value to you. We manufacture both **single and multiple spindle automatics.** Ask for Catalogue.

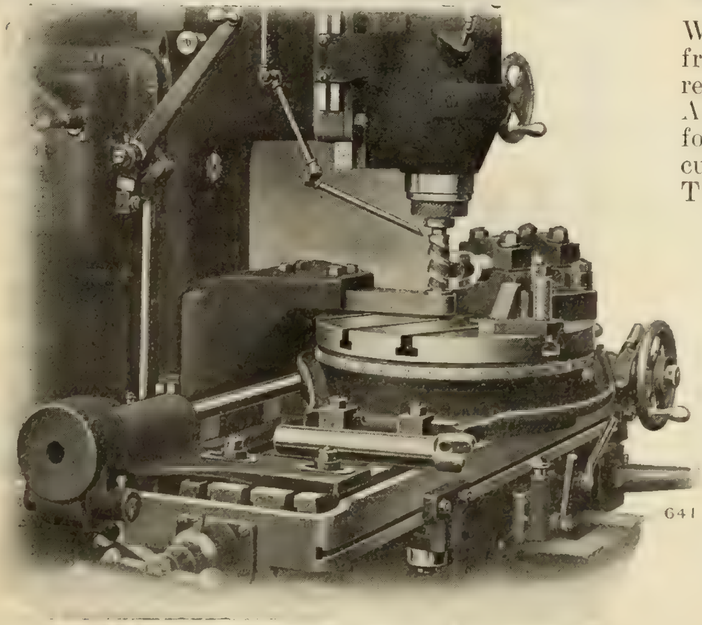
THE DETRICK & HARVEY MACHINE COMPANY
BALTIMORE, Md.

Time Per Piece—7 Minutes



Speed, 94 Revolutions. Feed, 2 1-4 in. per minute.
Time, per Piece, 7 Minutes.

We are now cutting our universal shaft forks from solid steel bars. The drawing shows them ready for milling.

A No. 3 Vertical with a 20″ Circular Attachment forms up the outside at one setting and at one cut.

This is possible because all feeds are set and controlled from the front of the knee without stopping. A combination of table, cross and circular feeds is used.

The next operation consists of milling out the fork for the ball seat. There are two fixtures. While the operator is filling one, the other piece is being milled. Time for this cut, one minute.

You will notice that the cutter is different from the usual end mill—suggests some of our advanced ideas in cutter design.

We are pretty far ahead in everything that relates to milling.

Ask for our New Examples of Modern Milling Practice.

The UNION ENGINEERING WORKS OF TOOL MACHINES

CHEMNITZ, in SAXONY

The largest special manufactory for the construction of Boring and Milling Machines

KEMPSMITH No. 32 Lincoln Miller

Built for rapid production of duplicate parts.

Illustrating methods of facing large quantities of small levers.

Jigs designed for quick action in loading and unloading.

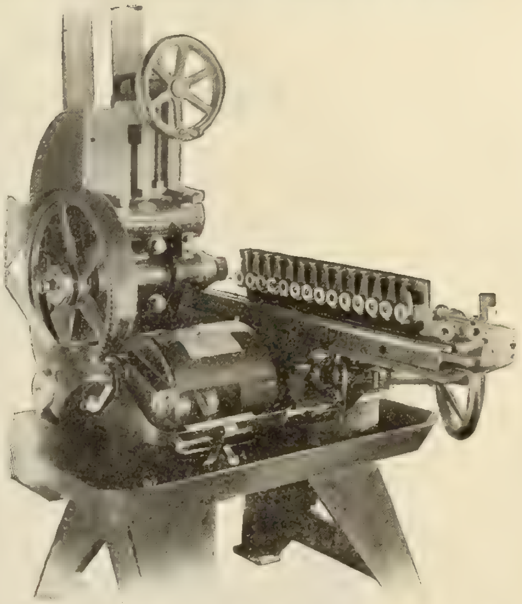
Speed of spindle, 78 r.p.m.

Rate of table feed .158″ per revolution of spindle.

Table travel 12¼″ per minute.

Total time for each piece, less than ½ minute.

This method shows a large saving over best previous lathe time.—Have you not some work that could be handled this way?



THE KEMPSMITH MFG. COMPANY

MILWAUKEE, WISCONSIN

WHY MILWAUKEE MILLERS

Are Built Exactly As They Are

No. 3—Work Table

The work table of a milling machine must not only be absolutely accurate when the machine is made and sold, but it must retain its accuracy during years of usefulness.

Experience has proved, however, that where the scale of the rough casting is left on the underside, the table does not long retain its accuracy.

The work table of Milwaukee Millers is made of semi-steel and finished **all over.** The T-slots are deep and the metal under the center slot is unusually thick. Table, cross and elevating screws are accurately milled from first-class material and are provided with micrometer dials reading in thousandths.

Thorough arrangements are made to catch the lubricant used on the cutters and to return it through screened pockets and telescopic tubing to the reservoir in the base of the machine.

If you don't read this paper next week you'll miss an important ''WHY'' in favor of Milwaukee Millers. Why not send for our bulletins, which gives the complete ''WHYS,'' with all the details you want to have.

Balanced Drive
Turning 3 Straight Diameters And 1 Taper Simultaneously
Automatic Measuring Device

THE *Lo-swing* LATHE

The Only Machine That Turns Taper and all Parallel Cuts on a Shaft Simultaneously

The saving in time effected by the *Lo-swing* in turning out work of this kind is apparent—all the tools cut simultaneously, thus saving turning-time and but one set-up is required.

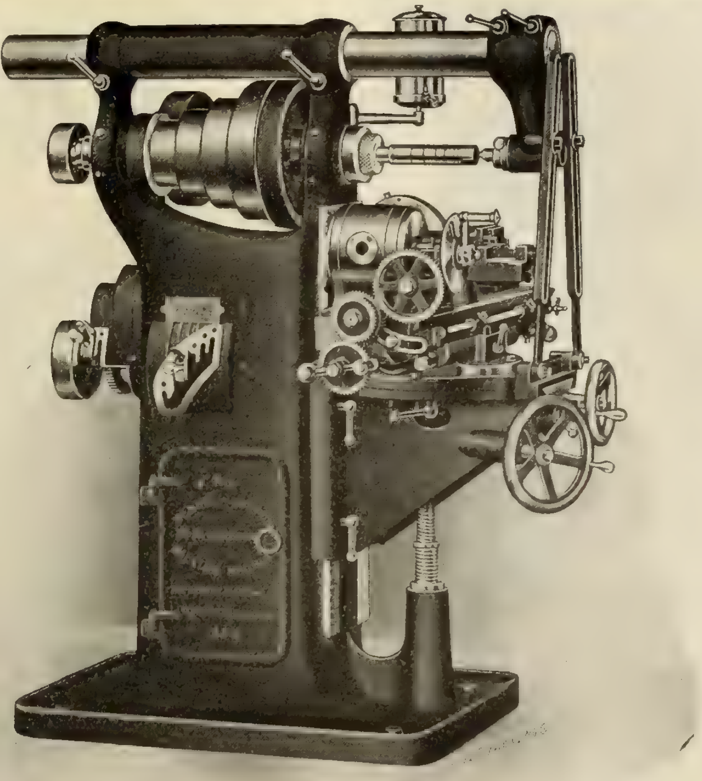
It has been proved in most cases that a job which takes two hours on an engine lathe, can be turned out in twenty minutes by the *Lo-swing*

FITCHBURG MACHINE WORKS

FITCHBURG, MASS., U.S.A,

SOLD DIRECT BY OUR REPRESENTATIVES IN CANADA AND THE UNITED STATES.

FOREIGN AGENTS—Alfred H. Schutte, Paris, Brussels, Cologne, Berlin, Milan, Barcelona. Schuchardt & Schutte, Vienna and St. Petersburg. Buek & Hickman, London, Birmingham, Manchester, Glasgow.



¶ We believe there are many shops which need a Universal Milling Machine of moderate dimensions, and which would find it a paying investment after they had installed one. To such a concern we recommend for careful consideration our No. 1½ machine shown herewith.

¶ They have been hesitating, perhaps, for fear that the machine with belt driven feeds is no longer useful, but has become obsolete on account of the all-geared drive mechanism applied so extensively to milling machines at the present time. We assure them that this is not the case. We manufacture both styles of machines, and this **No. 1½ is a very active member of our line.**

¶ There are thousands of small cutters made and used at the present time; many of them are carbon steel. This machine is amply able to produce efficient results with the class of work on which such cutters must be used.

The **workmanship** and **materials** entering into this machine are the best.

The **Spindle Journals** and **Bearings** are identical with what we have been using with such marked sucess for many years in all sizes of our lathes and milling machines.

The **arm** is a Solid High Speed Carbon Steel Bar.

The **knee** presents ample bearing surface for table and in addition has extended bearing on column of machine so that with arm, cutter and work are well supported, with freedom from chatter. Our machine has automatic cross, as well as longitudinal feeds.

¶ Get one of these machines and put it to work, and you will know you are making up for lost time.

N.B.—We have just issued a new and very complete milling machine catalogue, and shall be pleased to send you a copy.

HAVE YOU A GRINDING JOB LIKE THIS?

HERE is a man grinding hardened steel shafts used in lifting jacks—shafts are 1½ to 4 inches diameter—6 to 12 inches long—two cuts, rough and finish, are made with same wheel—six one-thousandths removed at each cut.

The wheel cuts clean, fast, cool—holds its shape—shows long life—turns out 50% more work and in less time than the best wheels previously used.

If you have a job like this—or any steel grinding—use the wheel he does—

ALOXITE

Tell us about the job—we'll see that you get the right wheel in the right place.

The Advantages of Grinding

Let's get down to brass tacks for a few minutes and see just what advantages grinding has over reaming.

Consider reaming—Reamers dull and wear undersize very quickly—the cost of keeping them sharp and up to size is a large item—a very little thing will make them cut oversize; for instance, difference in metals, or a little too much stock left by the roughing reamer.

Therefore, it is difficult by reaming to keep holes close to standards so that work will be interchangeable.

If holes are made to both Metric and English standards, a large stock of reamers is necessary.

It is difficult to ream a good, smooth hole in soft metal because it tears very easily.

Reaming is a very unsatisfactory method of finishing holes in thin bushings, because the walls of the bushing spring away from the cutting edge of the reamer, and if held in a 3-jaw chuck the bushing is easily distorted, making the hole three-sided.

Consider Grinding—Parts made of hardened steel, manganese steel, chilled iron, etc., cannot be reamed, and if a smooth, accurate finish is desired, **must be** ground.

On the other hand grinding produces better finished and more accurate work—holes can be finished day after day to very close limits and the standard of accuracy maintained, thereby producing work that is interchangeable and saving a lot of time on the assembling floor. Whether limits are by thousandths of an inch or millimeters does not matter—it is just as easy to work to one standard as to the other **without any extra equipment.**

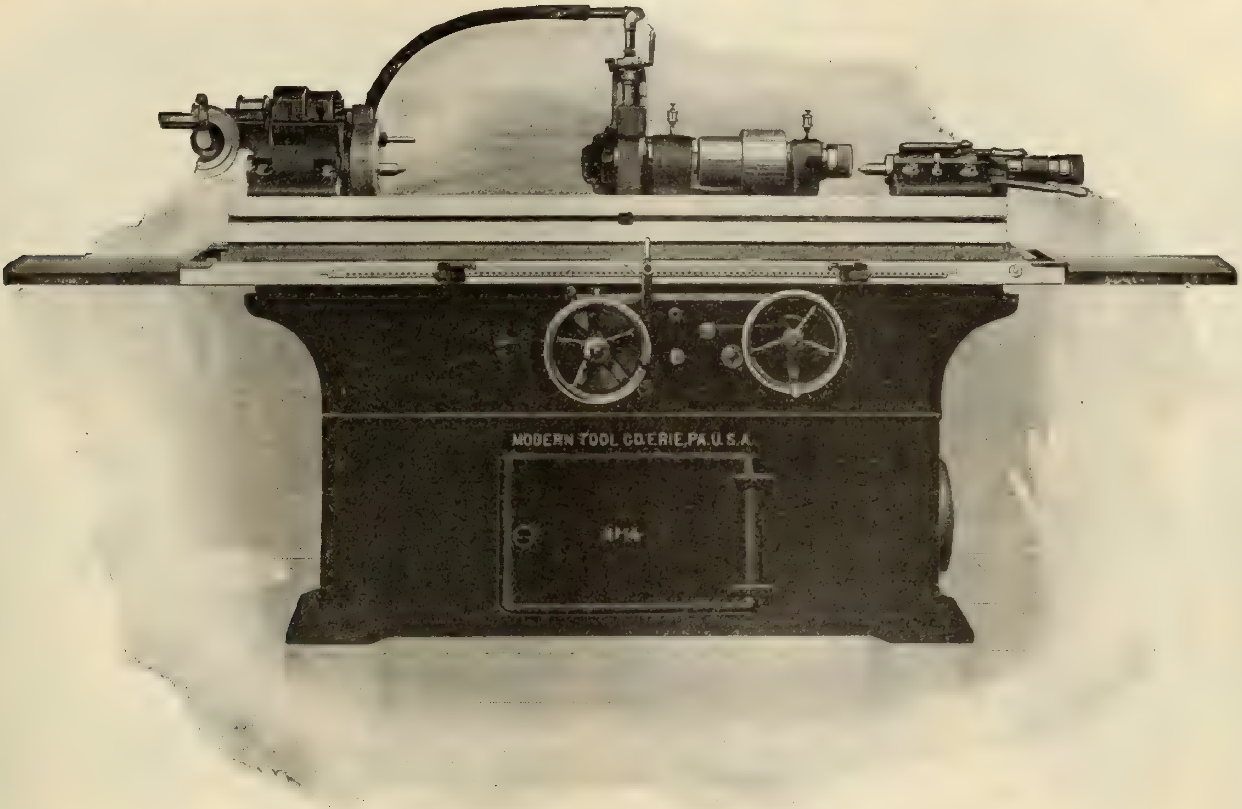
Some metals can be ground faster than hand reamed—for instance, lumen bronze. One firm substituting grinding for hand reaming cut the job price from one dollar a hundred to sixty cents per hundred for finishing the holes in small bushings made of this material.

But, mind you, it was not alone changing from reaming to grinding that made this saving possible, but the fact that they selected the HEALD INTERNAL GRINDING MACHINE with which to do the grinding.

They coupled the **most modern finishing method** with **the most modern internal grinding machine** and made a **big gain** over previous results.

The Heald Machine Co.
8 New Bond St. Worcester, Mass.

MODERN GRINDERS



No. 14 Plain. Capacity 12-in. x 44-in. Wheel 2-in. x 18-in.

Great strength and rigidity is assured by the heavy base with metal flowed correctly to absorb vibrations and prevent springing.

Accessibility—the driving and reversing mechanism is contained in a bracket bolted to the outside of the machine. Instantly accessible for oiling and repair.

Large wearing surfaces—all wearing surfaces are large and located away from grit and water.

Automatic cross feed gives a range of from .00025″ to 004″.

The hand wheel remains stationary while the table is moved by power. This arrangement eliminates shock.

Modern Grinders are built in Plain, Universal and Internal types. Unexcelled in accuracy, speed and durability.

Write for catalog immediately.

MODERN TOOL COMPANY

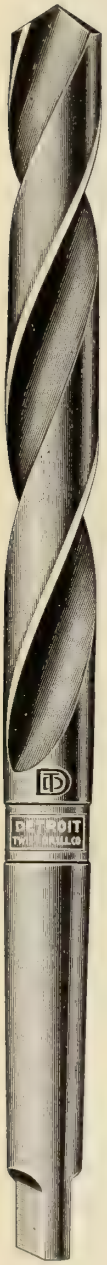
State and Peach Streets **ERIE, PA., U. S. A.**

Trade Mark

On Their Metal

The reputation of "Detroit" Tools rests largely on the steel that goes into them. Our Buyer is an expert and every piece of metal we use is selected because of its perfect adaptability to the exacting demands of "Detroit" Drill standards.

This steel is treated and tempered by men whose knowledge and experience perfectly qualify them for such vitally important work.



"Detroit" Twist Drills

Our equipment is the most modern and the most scientific that a scientific age affords, and every drill passes through the inspector's hands from three to eight times in the process of making.

No variation greater than the 1-2000 of an inch is allowed in any but the larger sizes and every other operation is characterized by the same degree of accuracy.

In competitive tests "Detroit" Drills have proved that they cut faster through more metal without grinding than other makes.

Send for Catalogue "R"; get a trial order, and prove this in your shops.

The Real Value of a File

THE real value of a file is its ability to preserve full efficiency for the labor that uses it. A file at 15, 20, 25 or 30c really represents $3.00, $4.00 or $5.00 of labor time on your payroll. A worn 15c file may demand $5.00 in labor time, where a new 15c file would only need $2.50 in labor time for the same work. See files are sharp. See each file has so many hours' work only, and no more. Replace files promptly and continuously. The decrease in your payroll will be much greater in cash than the increase in your file account. Sharp files pay.

"Nicholson-made" Files are sharp-toothed swift-cutting tools, made from private steel, and hardened by private processes. They are unique among files — different. They are sold all over the world. Instal them in your shop, and consume them generously for the sake of shop efficiency.

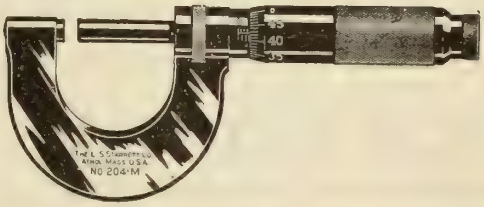
The Final Test

In a shop where thousands of duplicate parts are made, the inspection and tests which determine the character of the product must be absolutely reliable. The expert ability of the men who make the final tests counts for little unless the measuring tools are accurate. No doubt exists in shops using

Starrett Fine Tools



The Starrett Micrometer is always accurate. When the inspector gets a new one its accuracy is guaranteed. If hard service causes perceptible wear he can correct it by a partial turn of the sleeve with a spanner wrench. Then there's a Starrett "Mike" for every class of measurement. The Starrett Gages cover about every kind of work that requires a standard gauge. There are all kinds of Starrett Gages — thread gages, thickness gages, depth gages, taper gages, etc. They are all accurately made and convenient to use as a "final test." Now, if you're not sure of what you need in your work, send for Catalog No. 193. It will pay you.

Try-It-Before-You-Buy-It. Here's the way to do it.

Go to any reliable machinery supply dealer—**your own dealer preferred**—and ask him to give you a drill for a thorough trial. If he hasn't a Temco, in stock, ask him to write us and we will ship him a drill to demonstrate to you.

When you get a Temco in your plant you will realize why users in thirty different trades write us enthusiastic letters with their repeat orders.

The Temco taps, drills, sharpens tools and grinds valves—all at an operating cost of only one cent an hour. Weighs only 11 lbs. —length 15 inches over all. Attaches to ordinary A. C. or D. C. socket.

Use the coupon to secure a descriptive catalog.

We Are Hack Saw Specialists

Examine VICTOR Teeth

VICTOR hack saw teeth are milled, not punched. For this reason their sharp points do not crystallize under hardening.

Every Victor tooth is a separate cutting tool of supreme toughness square across the blade. This means efficiency—one hundred per cent.

VICTOR HACK SAWS

are made only from expensive Victor Private-formula Steel. They hold their edge to the very maximum amount of cutting—we prove this at great expense, three hundred days in the year, for our own protection.

Use Victors and see for yourself.

Send for price list 'C.'

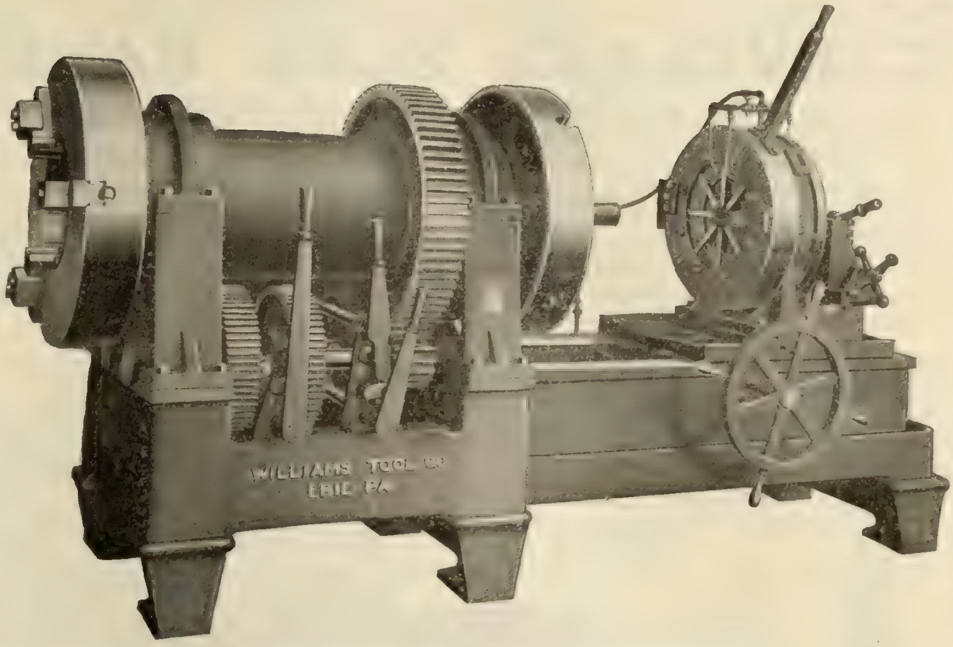
¶ A Pipe Machine might be built that outwardly would resemble the Williams. But it would be a difficult matter to equal the superior quality and efficiency of the Williams Machine. These represent years of patient experiment with various metals and hardening steel.

¶ It is simply astonishing how slight a variation in the degree of hardness or angle of clearance seriously affects the cutting and lasting quality of pipe machine dies.

¶ Why take chances? *Why not have the machine that has been tried and tested in 1,500 shops and not found wanting?*



Drop us a line stating capacity of machine in which you are interested.

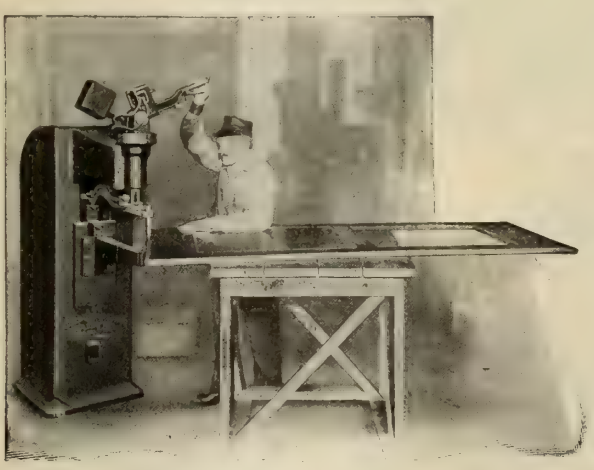
RIVETING COSTS REDUCED



It's the Electric Way

Manufacturers of steel doors find they can increase their output over 100 per cent. by spot welding, as shown at side; 60 per cent. stronger and 85 per cent. cheaper than riveting. No holes to punch, no rivets used. It's the rivetless riveter.

Our No. 12 free bulletin tells all about them. No. 11 bulletin tells the story of butt welders. And we have a 30 days' free trial proposition for you.

NO LEASE. **NO LICENSE.** **NO ROYALTY.**

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

Sand Rammer in operation.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock: — RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE - ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

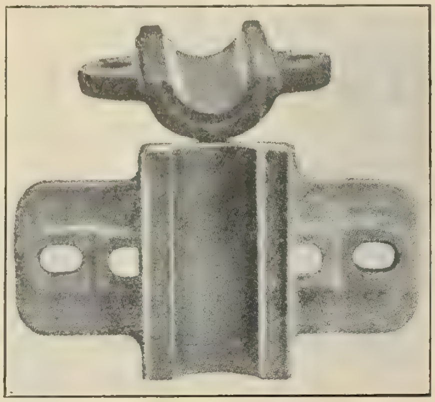
GRAPHITOL

Pat. and Trade Mark Registered.



New Anti-friction Material Bearing.

Graphite is nature's greatest lubricant.

Pure graphite hardened in the **Graphitol** way makes the most frictionless machinery bearings possible.

Graphitol has recently been improved to such a degree of excellence that it is becoming of unquestioned value for many purposes.

Graphitol is shipped in powder form, is mixed with a prepared liquid when required, and applied in paste form, when it hardens durably.

Graphitol bearings mean reduced initial cost, greater efficiency, less oil, and cool running.

NOTICE THE ADVANTAGES OF

THE "RYLAND"

PATENT — WORM — SCREW — PULLEY — BLOCK

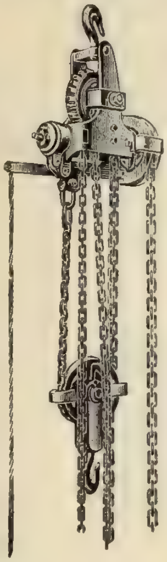
ADVANTAGES

1st—No brake friction whilst hoisting.

2nd—Entirely self-sustaining.

3rd—The sustaining brake power is always proportionate to the load.

4th—The load, in addition to being lowered in the same way as other worm blocks, can be lowered **quickly**, either with or without load, by pulling the cord, thus saving an immense amount of time.



ADVANTAGES

5th—Speed of lowering can be controlled by the operator.

6th—Rapid lowering and brake control enable more work to be done in a given time by this block than by any other worm block on the market.

Made in four sizes, at present, viz., ½, 1, 1½ and 2 tons.

Send for list No. II.

Suppose Your Roof Were a Slab of Stone!

You wouldn't think of putting coating or gravel on it to water-proof and preserve it. You wouldn't worry about its rotting, rusting, drying out, melting or deteriorating in any way. And you wouldn't be alarmed if sparks or burning embers from a fire next door fell on your roof. J-M Asbestos Roofing is practically such a *stone* roofing. It consists of layer on layer of Asbestos (stone) Felt securely cemented together with Trinidad Lake Asphalt —*two indestructible minerals.*

J-M ASBESTOS ROOFING

is practically indestructible. This is proven by the fact that it is still in good condition on many buildings where it has been in service for more than a quarter century without coating, gravel or repairs. It has withstood the fierce flames of a plumber's blow-torch for nearly an hour without injury or without the boards to which it was nailed being even scorched. Half a century of roofing experience and our positive guarantee of satisfaction are behind J-M Asbestos Roofing.

This roofing is suitable for all kinds of buildings in any climate. Your dealer sells J-M Asbestos Roofing—if not, send your order to our nearest Branch.

Write nearest Branch for Samples and Catalog No. 303.

INTERESTING FIGURES
BY A
FAMOUS ENGINEER

Professor Robert H. Smith, of England, a distinguished Mechanical Engineer, Knighted for his scientific attainments, etc., recently had occasion to make a careful test of MAGNOLIA METAL, and we give below extracts from his report:

> ''Each bearing was run for some hours under moderate load and with oil lubrication in order to rub it down to a good fit upon the journal. It was then well cleaned out, and the measured friction tests were run with **water lubrication** and cooling only. This appears to be the only satisfactory method of comparative testing of bearing metals, because the influence of small differences in quality and quantity of oil is so great as to mask to a large degree that of differences in the metals. The use of water also admits of the quantity of heat generated being measured with approximate accuracy.''

Further on in his report he says:

> ''This (Water) test proves that Magnolia Metal can be easily **run continuously** at over 130 lbs. per square inch load at from 400 to 450 r.p.m., with a co-efficient of friction varying from .05 to .07 **with water lubrication.**''

Here we have a positive statement by perhaps the greatest living authority on such subjects that Magnolia Metal can be run continuously at certain loads and speeds independent of oil lubrication.

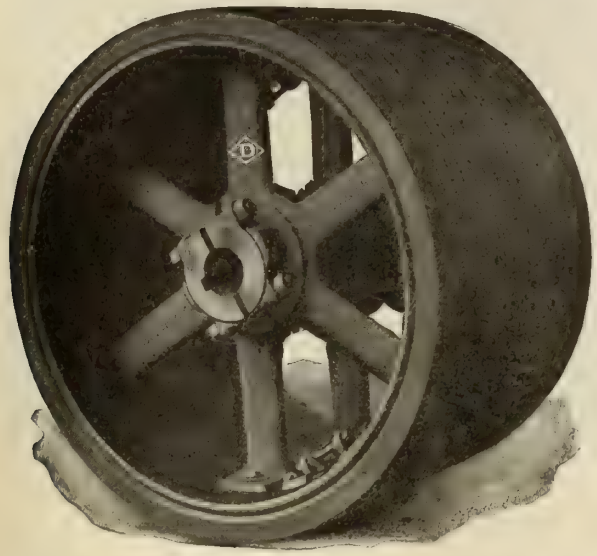
The Pulley Without a Peer



DODGE
IRON CENTRE
WOOD RIM
PULLEY

¶ The combination of wood and iron is an engineering triumph. The wood rim gives high tractile efficiency, tests showing that it is superior to iron in the proportion of 46 to 22. Lighter belts and less tension can be used thereby minimizing pressure on bearings, all of which decreases friction.

¶ It can be run at a higher speed than any other pulley, — one of these pulleys was tested to a rim speed of five and a half miles per minute without any resultant damage.

¶ Made solid and split in all sizes to twenty feet in diameter, for any strength, for any speed and for any service for which belting can be used. It is a pulley that is quite in keeping with the other members of the famous Dodge Line of Power Transmission Equipment.

The Science of the Study of Men

¶ We are learning a new Science—**the Science of the Study of Man.** We must deal with men every day in every transaction, and we have discovered that there are too many failures, too many half successes, too much guessing at business principles and policies.

¶ We have turned our investigations and inquiries into the recesses of infinite space and everywhere we find activity, change, decay and evolution—all of which is a part of the great drama of material and energy, the growth and building up—the decay and the decline of planetary systems, worlds and suns.

¶ In the constellation of Orion, the great nebulous masses, we find on closer investigation to be worlds in embryo—that is, worlds in the earliest stages of their development. During the centuries gone we have learned that the conditions of life on our planet have entirely changed.

¶ We have determined that all animal and vegetable life will disappear from this planet in the final stages of its growth and decay, and that this process of change prevails throughout infinite space. These things are mathematically certain, and these processes are now easily discerned from our powerful telescope, aided by the use of the spectrum.

¶ But we are learning a new Science that is of greater importance than the science of astronomy or the science of mathematics. We must deal in this world with **material, merchandise, machinery** and **men**—and men is the last and greatest problem we have to analyze.

¶ Ninety-five per cent. of men at the age of sixty-five are either working for a daily wage or entirely dependent on someone else for their support. These men, after old age has overtaken them, present a sad picture, and there is nothing more pitiful than old men tottering along, living their last days in want, misery, sorrow and shame; men whose hair is touched with silver, trodding on to that of oblivion of mediocrity where the individual is submerged, where all individuality is lost.

¶ No one is prepared to say the final word concerning the correct training of men, but one thing we know quite well; they must be trained in the atmosphere in which they are to perform their work. Men are developed through responsibilities, through contact with everyday life. We learn as we go on, experimenting, and life itself is only an experiment, and as Leckey has said, "Over the evening of our dreams there steals the thought that we have been used by an Unseen Power for an Unknown End."

¶ Each of us offers the same old excuses, the same drivel, the same childish answers for laziness and indifference; the same paltry reasons for our indolent lives. Failures are about us everywhere; many of them the sons of successful men. Many have college educations, and on every hand we find men familiar with Latin, Greek, dead languages, and dead literature, whose lives are just as dead as the things they know.

¶ We have seen that many young men who are pursuing a course in Greek should be equipping themselves for the work of an architect. Oh! we may argue this way or that, but the figures stand. Ninety-five per cent. of men at the age of sixty-five are either working for a daily wage or else entirely dependent on someone for their support. It is in the laboratory of everyday life that we find the facts with which we must deal, and **the demand for men is universal and the supply is shamefully small.**

¶ So—we conclude that men in years to come will be compelled to make better use of their time in preparation and training, to give greater care to their health. And just here it may be well to point out that we find at last that sickness is not really necessary; that men were intended to be healthy and happy—that our sorrow and sadness and failure are largely the results of our sins, folly and neglect.

Efficiency

SKEFKO.SKF

(PATENTED) MADE IN ENGLAND.

Ball Bearings

Every feature in a SKEFKO Bearing has been worked down to the closest possible refinement, embodying simplicity, ruggedness, accuracy and the greatest load-carrying capacity. No parts can work loose, rattle or cause bearing failure. The retainer is but one piece of Swedish Lancashire Steel. It performs *right* and is proof against trouble. Moreover, it will not collect grit or other harmful matter.

SKEFKO is the only truly self-aligning bearing. This feature alone is worth most careful consideration.

The outer ball race is machined and ground to a radius struck from the centre of the bearing. The inner race is provided with two grooves, ground slightly larger than the radius of the balls. The balls, cage and inner race, retain precisely the same spacing with reference to each other at all times, and rotate as a unit within the spherical surface of the outer race. The whole constitutes a practically perfect ball and socket joint, capable of adjusting itself instantly and automatically to any spring of the shaft upon which it is mounted. Absolutely no cramping strains can be introduced on the balls, and the permissible arc of deflection covers a range that would instantly destroy a bearing of any other type.

Time and again automatic self-alignment, as obtained exclusively by this construction, has brought success with SKEFKO Bearings where rigid bearings had failed utterly.

SKEFKO Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition, and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

MONTREAL QUEBEC ST. JOHN OTTAWA TORONTO
WINNIPEG CALGARY SASKATOON VANCOUVER

Plant Improvement, Steel Co. of Canada, Ltd., Hamilton, Ont.

By C. T. R.

The brief illustrated description here given, covering the main features of the equipment added to the previously well appointed works of the above corporation, serves to demonstrate on the part of our large employers of labor the two-fold attribute of confidence in the great future ahead of our Dominion and of an appreciation of the value of keeping abreast of the march of progress in science and invention as exemplified in the realm of mechanical engineering.

FROM time to time considerable prominence has been given in the editorial columns of Canadian Machinery to investigation and development work undertaken with a view to the simplification of operation, while at the same time increasing the efficiency standard of rolling mill equipment. In our issue of June5, this year, will be found an illustrated description of an Electrically Driven, Two High Reversing Rolling Mill.

The Steel Co., of Canada, Ltd., have recently made extensive and costly additions to their plant at Hamilton, Ont., which should be of interest to all observers of Canadian industrial development. The use of steel has grown to such large proportions the world over, that its manufacture is carried on in immense plants involving great amounts of capital, particularly in the United States and Germany. The capital invested in all of these modern works is expressed in terms of millions of dollars, and the output in terms of hundreds of thousands of tons. It is such a plant that has recently been completed and put in operation by the Steel Co., of Canada, who engaged the well-known firm of rolling mill engineers, the Morgan Construction Co., of Worcester, Mass., to design the entire equipment. The Morgan Company have designed and built about seventy plants in the United States, England, Germany, France and other countries, and their mills are to be found in every large and successful works of the first named.

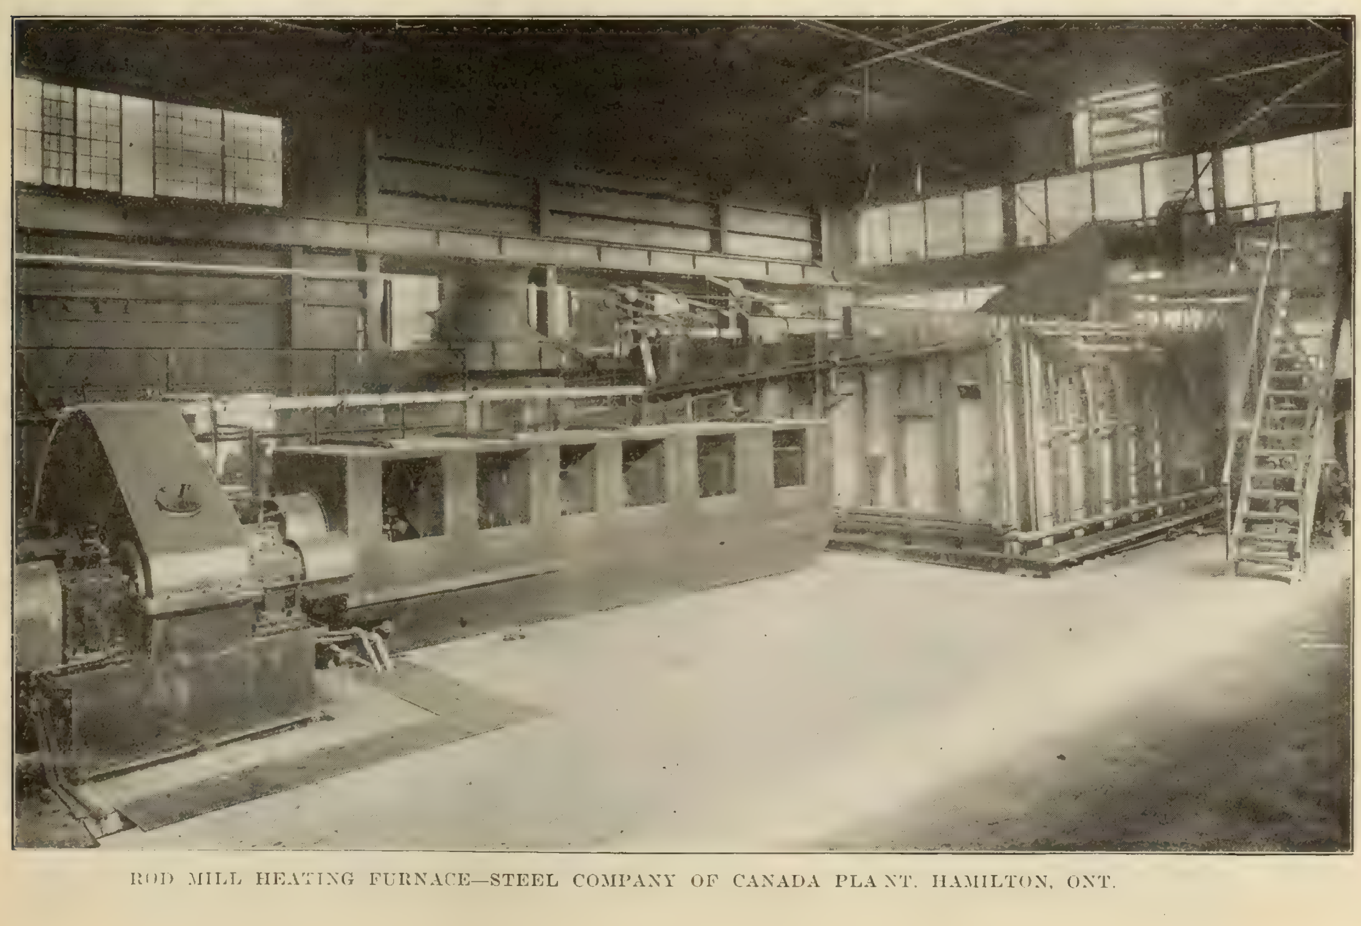
The Electrical Feature.

The new mills at Hamilton, Ont., therefore, embody the widest experience and latest development in steel rolling mill construction. Advantage has been taken of the electrical power supplied by the Dominion Power & Transmision Co., to drive the new mills, and it is expected that the cost of power will be equal to the cost at plants in the States more favorably located with reference to coal fields. The roll trains as well as the auxiliary machinery such as roller tables, cranes, pumps, transfers, etc., are driven by electricity. The total number of electric motors installed in the new mills, aggregate about fifty, ranging in size from a massive ten thousand horse power reversing motor to a diminutive ten-horse power unit.

A large part of the alternating current used is converted to direct current where conditions made the use of direct current advisable. The equipment of rotary converters, static transformers and special motors, make the electrical installation one of the most interesting and noteworthy yet installed in the Dominion, and it is particularly interesting to record that it was all made in the City of Hamilton by the Canadian Westinghouse Co.

Output Capacity Increased.

Heretofore the Steel Co. of Canada have been making on a small scale only a portion of their steel requirements. The new mills, together with increased

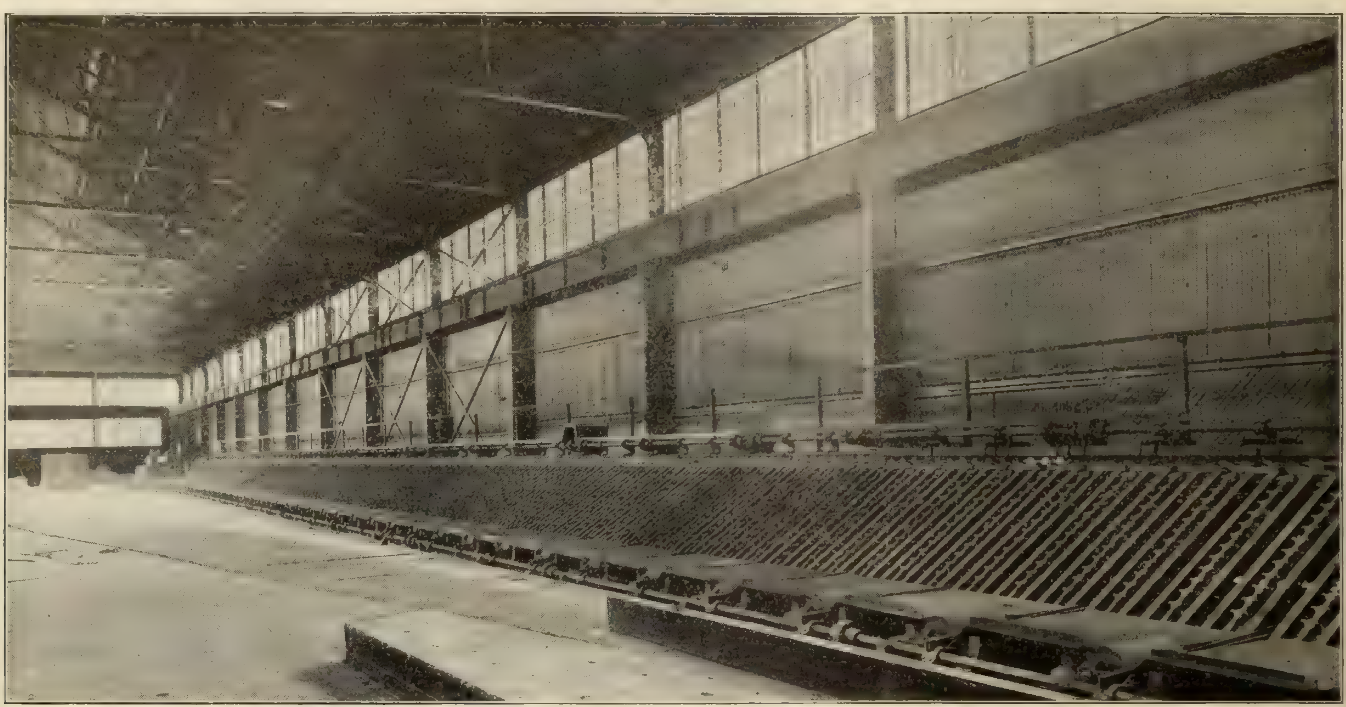


ROD MILL HEATING FURNACE—STEEL COMPANY OF CANADA PLANT, HAMILTON, ONT.

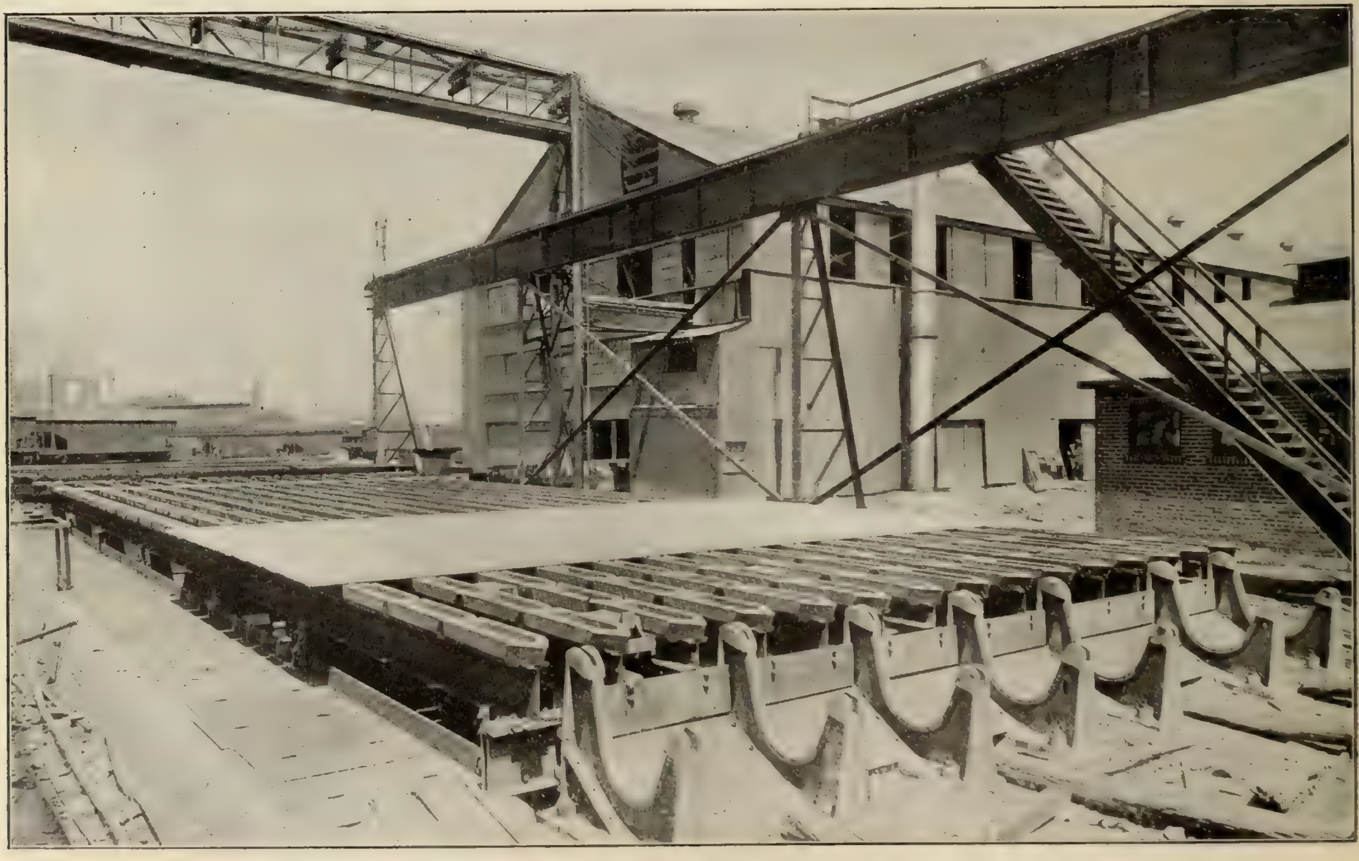
steel melting capacity just finished, enable them to supply their various large departments with raw steel in the shape of billets, blooms, slabs, bars and wire rods. All of the recent additions have been planned with a view to early and still greater extension to keep pace with the rapidly growing market for steel products.

Modern rolling mills are really automatic machines on a large scale, one machine sometimes covering an acre or more of ground, and operated by a few men almost entirely without hard muscular labor. Although the material being worked consists of red hot steel, first in large masses and later in small sections travelling at great speed, the operators suffer little from heat, and are exposed to very little danger from burns.

A detailed description of the mills is not available, but we offer seven photographs which give an excellent idea of the magnitude and character of the construction. The work illustrated consists of three separate units as follows:



COOLING BED OF BAR MILL—STEEL COMPANY OF CANADA PLANT, HAMILTON, ONT.



BILLET HOT BED - STEEL COMPANY OF CANADA PLANT, HAMILTON, ONT.

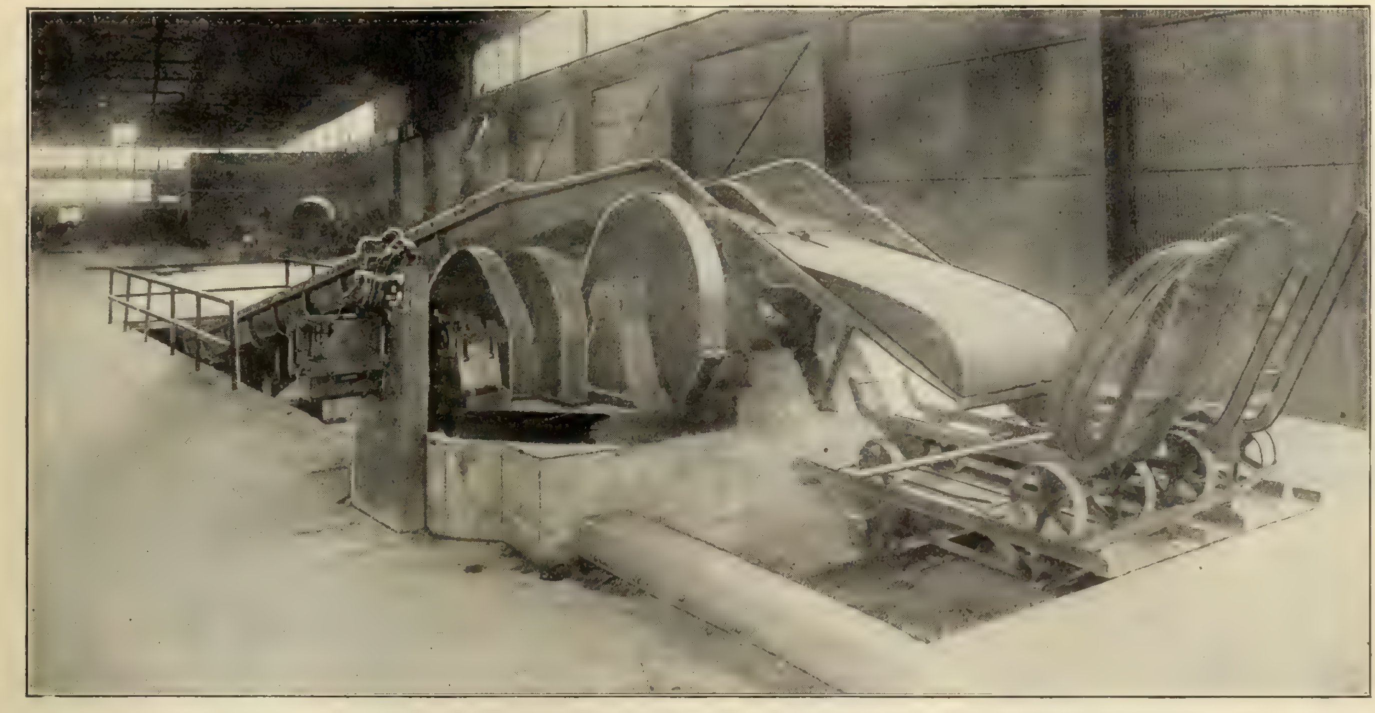
Mill Features.

One two-high reversing bloom or cogging mill for reducing 4,200 pound ingots to slabs of any width up to 24 inches, and blooms from 4 in. x 4 in. to 10 in. x 10 in. The capacity of this equipment is 300,000 tons per year, and its builders, The United Engineering & Foundry Co., Pittsburgh, Pa.

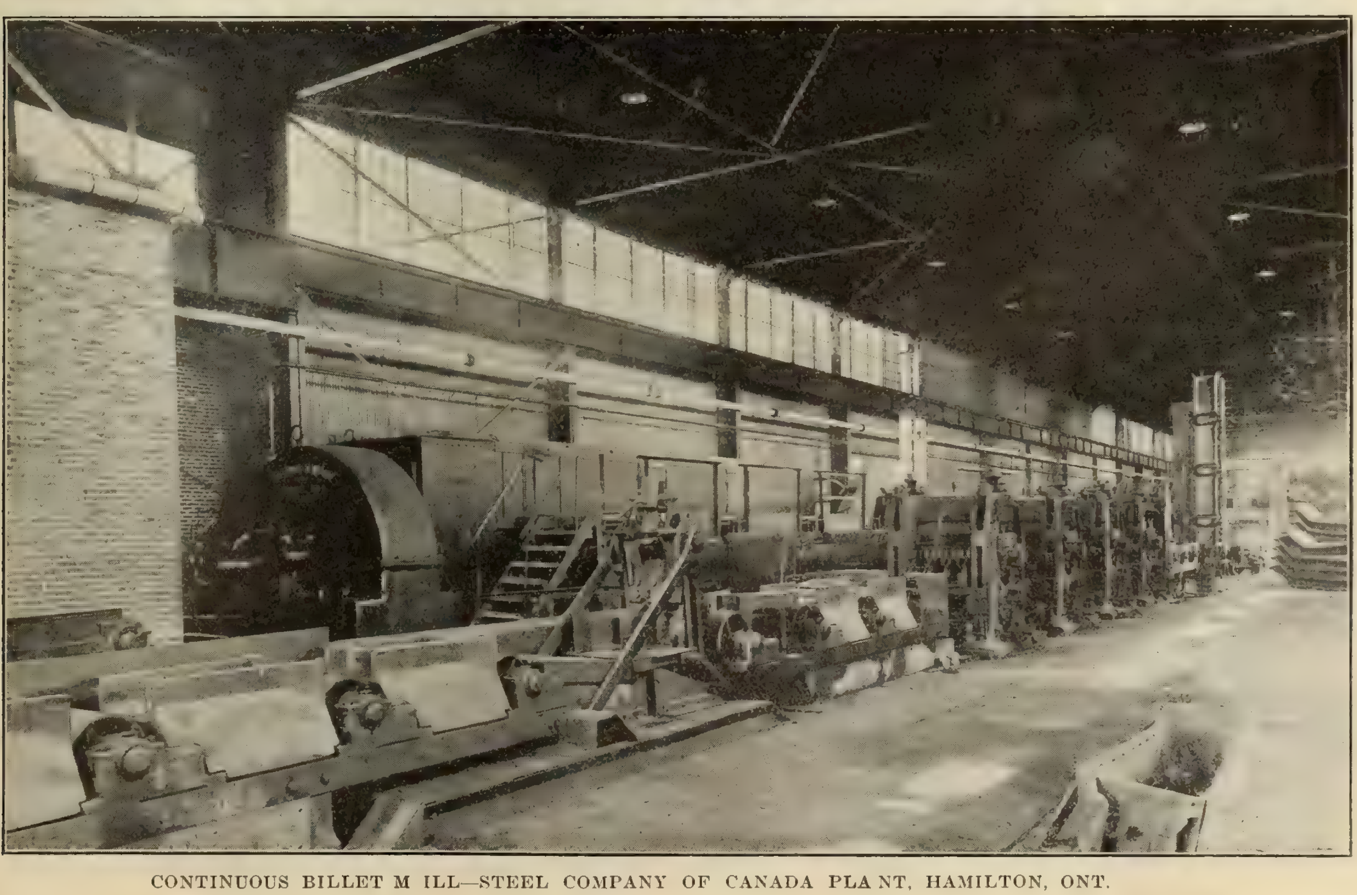
One continuous billet mill for receiving hot blooms direct from cogging mill, and reducing same to 1¾ in., 2 in. and 2½ in. square billets, or equivalent sections of flats. The product of this mill is cut by a flying shear as it issues from the mill in lengths from 15 ft. to 30 ft. as desired. The capacity is 300,000 tons per year, and the builders, the Morgan Construction Co., Worcester, Mass.

One continuous wire rod and bar mill for producing wire rods from No. 5 size up to any size required, and accurately rolled bars from ¼ in. to 1 in. round and equivalent sections of squares, flats, half-ovals, angles, etc.

Wire rods are rolled by the pure continuous process, and the steel is not touched by hand from the time the billets leave the stock pile until the coiled rods are taken from the bundle con-

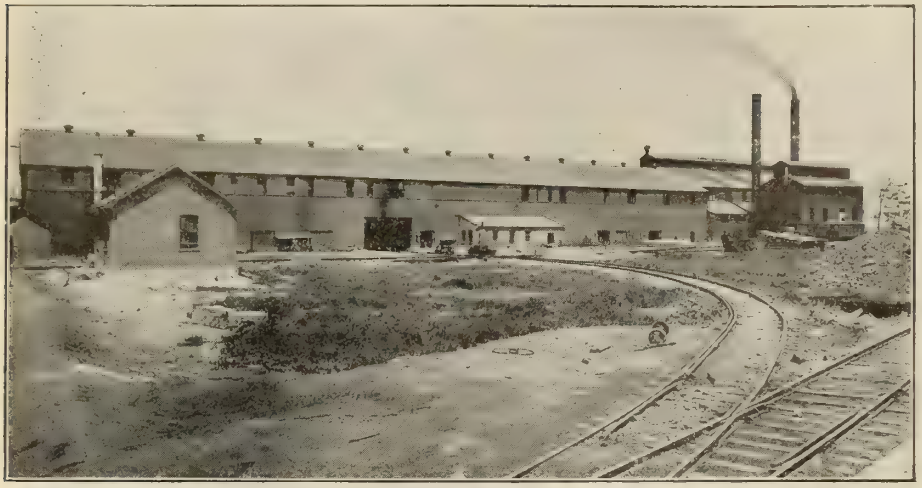


DELIVERY END OF ROD BUNDLE CONVEYOR—STEEL COMPANY OF CANADA PLANT, HAMILTON, ONT.



CONTINUOUS BILLET MILL—STEEL COMPANY OF CANADA PLANT, HAMILTON, ONT.

veyor. 300 lb. billets are used in 30 ft. lengths, and finished into one piece of coiled No. 5 rod, 2,700 ft. in length. As two strands are rolled at one time, more than a mile of rod is produced each minute, and the capacity of the mill is 100,000 tons of wire rods per annum. By reason of improvements recently perfected by the designers, the rods produced are of superior finish and retain the well-known superior softness and temper produced only on continuous mills.



COGGING AND BILLET MILL BUILDINGS—STEEL COMPANY OF CANADA PLANT, HAMILTON, ONT.

Special arrangements heretofore found impracticable have been successfully made in the rod mill for the production of merchant bar shapes requiring accurate section, such as bolt, rivet and spike stock. The capacity of the mill when rolling these bar sections is about the same as when rolling wire rods. The Morgan Construction Co., Worcester, Mass., were the builders of this rod mill.

The buildings, which are all of fireproof construction, were erected by the Hamilton Bridge Works Co., and are perfectly lighted day and night.

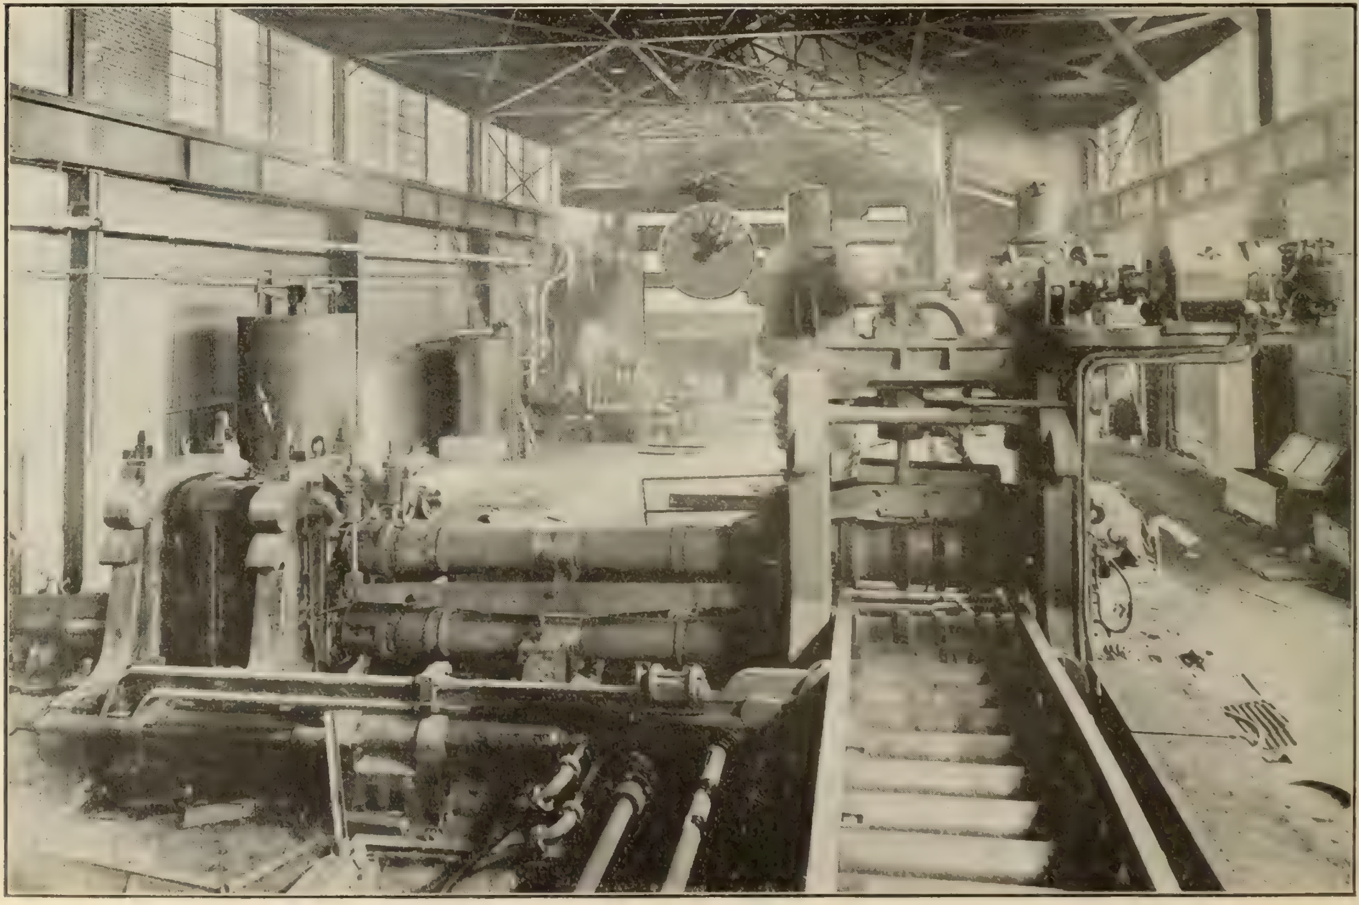
Crushers, elevators and storage bins have been installed at each mill for coal employed for making gas, and every well proved mechanical device for saving labor and insuring the comfort and safety of the workmen has been generously provided.

SCORES MONTREAL HARBOR CONGESTION.

SPEAKING of the grain blockade at Montreal, Mr. A. A. Wright, managing director of the St. Lawrence and Chicago Steam Navigation Co., said: "Montreal as a national harbor is a disgrace to the community." According to Mr. Wright there are about 1,500,000 bushels of grain floating in Montreal harbor. It takes from three to five days to clear a boat from port, while under ordinary circumstances it should take about a day.

The blockade at Montreal has a far-reaching effect, and is responsible for a similar condition at the various ports along the lakes, owing to the fact that so many boats are tied up. The elevators at Port Colborne are loaded to capacity and have been for some time for this reason.

When asked whether his company would press any extra boats into service to handle the crop, Mr. Wright said, "There is no use. We can't get the boats we now have running unloaded." The entire Merchants' fleet runs a full season, and consequently further arrangements are not necessary.



REVERSING COGGING MILL—STEEL COMPANY OF CANADA PLANT, HAMILTON, ONT.

The Theory and Practice of Screw Cutting on the Lathe

By J. Davies

The author of this series of articles intimates his intention of making the information sufficiently simple and clear, that apprentices and others with only the four rules of arithmetic at their command will be able to intelligently grasp the data and apply it in practice.

When cutting short threads, the tool is generally carried back to its starting place by means of a crossed belt, which reverses the lathe, but, in a very long job, this would be a serious waste of valuable time.

Engaging the Nut.

The quickest means of taking the saddle back is by hand, but in doing so we must determine the exact time and place for putting in the nut for the next cut.

(1).—When the number of threads required to be cut can be divided by the number of threads on the leading screw without a remainder, the nut can be engaged at any time or place.

(2).—When the leading screw makes two, three, or any number of complete revolutions to one revolution of the face plate, put a mark on the job or face plate with the carriage up against the headstock; then, on every revolution of the face plate, when the mark comes to a given place, the nut can be engaged.

On a slow running job, put a mark on top of the face plate, and another on top of leading screw, then when both marks are on top together, the nut can be engaged, the saddle is touching the headstock at a definite starting place.

In all other cases, put down the pitch in fractional form. If the pitch to be cut is a complete number, such as 4, 5, 6, threads per inch and so on, then the numerator of the fraction representing the pitch is the least number of inches the saddle must travel, after taking the nut out of gear, before it comes to the right place to put it in again.

If the thread to be cut does not contain a complete number of threads per inch, find ratio, or refer to the ratio already found in working out the wheels. The numerator of the ratio will represent the least number of revolutions your leading screw must make after taking out the nut before you can put it in again.

Example. — It is required to cut a screw 5/8 pitch with a leading screw five threads to the inch.

$$\frac{5}{8}\times\frac{5}{1}=\frac{25\ \text{No. of rev. of guide screw}}{8\ \text{No. of rev. of job.}}$$

=5 inches.

Put the saddle against the headstock, packing piece, or other means of definitely locating the starting place, measure on the lathe bed the number of inches required, or some multiple of same according to the length of screw to be cut, stop the lathe at the mark on the bed, and run the carriage back to the starting place for a fresh cut.

TYPES OF MANAGERS.

By a Foreman.

The engineering trade, like all others, has men of varied characteristics and temperaments who occupy controlling positions.

System Personified.

Those who have held the position of shop foreman in various shops have come across the manager who is system personified, and who carries that particular card system of his own to extreme and unwarrantable lengths, the shops being flooded with cards for every little detail, and of all the hues of the rainbow. A card system, properly organized, is one of the blessings of good management, each card checking and helping the other, all working to attain economical output and up-to-time delivery, not forgetting the first and all important point, that of being able to find at any moment when necessary actual facts regarding the cost and progress of any particular order which is going through. This last point is one which justifies the adoption of a card system, even if no other reason is taken into account, but care must be taken not to let the card system run the shops, instead of the shops running the system. The system adopted should be one of the items of the works as a whole, and used as a means to an end, without allowing it to assume such importance that everything else becomes subservient to it.

The Tactless Manager.

Again, there comes that type of man who is tactless in his methods of dealing with those under his control, treating them all as numbers and parts of the organization instead of human beings like himself. In the majority of cases he is a man of wide experience, as his disposition has compelled him to be continually on the move from one part of the country to another, the various shops which he has controlled breathing a sigh of relief on his departure. A foreman, like all human beings, has a temperament of his own, and the tactless manager who has only one method for those under him will find his orders carried out under compulsion, instead of willingly as they should be. Just imagine a shop where the foreman himself is tactless. It is very soon in an uproar, every man working against the other, but all united in their common hatred.

The Unreasonable Manager.

Then, there is the unreasonable type to consider, these being by no means in the minority; the most peculiar thing about them usually being that when they are forced to consider their unreasonableness on account of a foreman kicking against it, they own up to it. Should a foreman, however, have an unassuming manner, and not be able to hold his own in an argument, he leads a most uncomfortable life, and from hour to hour wonders what unreasonable thing will be wanted of him next. This results in a good man lost, as however good and efficient a foreman may be in the control of his own department, he will never rest content under unreasonable demands, and will be continually on the look-out for a place where his capabilities will be recognized, and a free hand given him to exercise them, standing or falling by the results attained.

The Conceited Manager.

Lastly, there are the managers who want to know every little detail and happening from day to day in the shops, some portions of the work being even stopped during their absence while awaiting their decision, they thinking that whatever is done will be wrong unless expressly authorized by them. This may be right in a small works, but, even then, the respective foremen should be allowed to use a certain amount of discretion in details. The manager, of course, in accordance with his position, defines the general rules for the works as a whole, any alteration to be put before him for his decision, but if the foremen are allowed latitude consistent with their capabilities, far smoother operation is concerned, each working with the other, the result being increased economy and better results at the year end.

Qualifications in a Nutshell.

The first attributes of anyone holding a controlling position, whether foreman or manager, should be absolute fairness to all, no favoritism shown, and straight forward dealing, coupled with, of course, the necessary knowledge of the branch or branches of the trade controlled, the resulting opinion of those who work for him being the best a man can have, viz., "He is a strict disciplinarian, but always conscientious and never unfair."—Machine Tool Engineer.

EXHAUST VENTILATION.

A SHEFFIELD factory inspector reports that, though exhaust ventilation has been provided throughout the grinding trades, he is not satisfied that it is perfect in all cases. The cyclones are already wearing out by the constant whirling of the dust round the inside, and the corrosion on the outside by the weather. As a substitute for these, brick chambers have been built, connected by a pipe to the chimney stack. They appear to be satisfactory, and to prevent the dust from escaping into the atmosphere.

He regrets that the workmen themselves do not carry out their share of the duties to the full extent, and finds exhaust ducts stopped up owing to improper things being allowed to enter; hoods not properly adjusted; glass in the hoods broken; and sometimes grinding being done with the valve between the hood and the duct closed.

Again, in those places where respirators have to be used, men are frequently found racing stones without them, and others working in the room at the same time. The weekly cleaning does not appear to be done as regularly as it should be done, though special visits of inspection are paid for the purpose of enforcing it.

OPERATION OF ELECTRIC LOCOMITIVES.

APART from the technical features of the motors, control and switchgear, with which the running staff have little to do, the operation of electric locomotives, the Railway News points out, is very simple indeed, there being no indicators to watch, no fire to call for careful and skilled maintenance under every varying conditions, and virtually little for the engine crew to do beyond keeping a good look-out and manipulating switch and rake gear intelligently.

The working parts also are very simple, owing to the absence of pistons and piston-rods, eccentrics, valve motion, etc., while the moving parts of the control are light, easily accessible for inspection and repair; and the working parts as a whole are not subjected to the heavy strains which apply in the case of the steam locomotive.

In maintenance, too, the electric locomotive is superior. The workshop equipment need not be elaborate, and, except for machines for winding armature and field coils and a few special items, a portion of the usual machinery of a steam locomotive works is all that is necessary. A strong feature is also made of the policy of using stock parts, so that it is only at long intervals that an electric locomotive requires thorough overhauling.

GROWTH OF STEEL PASSENGER CAR EQUIPMENT.

THE Wall Street Journal says: In view of the fact that four bills are pending in Congress requiring the replacement of wooden passenger equipment with steel equipment, the Special Committee on the Relations of Railway Operation to Legislation made inquiries as to the process of the construction of steel and steel underframe equipment. Replies from 247 companies operating 227,754 miles of road in the United States, and from roads operating 24,718 miles in Canada were received.

Between January 1, 1913, and July 1, 1913, orders have been placed by railways for 1,140 passenger equipment vehicles. Of these, 1,064, or 93.3 per cent., are of steel construction, and 76, or 6.7 per cent., have steel underframes. The steel and steel underframe passenger equipment in service on the dates named was as follows:

	Steel.	Steel Underframe.
January 1, 1909....	629	673
January 1, 1910....	1,117	1,098
January 1, 1911....	3,133	1,636
January 1, 1912....	5,347	2,399
January 1, 1913....	7,271	3.296
Increase.		
1913 over 1909....	6,642	2.623
1913 over 1909	1,055%	389%

The approximate cost of replacement of wooden equipment for steel is as follows:

	No.	Av. cost.	Amount.
Postal ...	680	$11,000	$ 7,480.000
Mail & bag.	2,724	10,000	27,240000
Mail, bag. & passenger	679	10,000	6,790,000
Bag & pass	3,757	10,000	37,570,000
Bag or exp	7,431	8,500	63,163,500
Passenger	23,692	13,800	303,257,000
Parlor, sleeping, dining..	6,864	22,000	151,008,000
Business .	774	15,000	11,610,000
Motor. ..	325	20,000	6,500,000
Total ..	49,626	.....	614,619,100
Annual int. charges at 5%..			30,730,900

VANADIUM CAST STEEL.

THE use of vanadium cast steel for frames and other parts of locomotive construction is continually increasing in the United States, and some tests recently carried out on a frame designed for a Pacific type locomotive intended for the Southern Railway have demonstrated the remarkable strength and toughness of the material.

According to the Railway Gazette, the frame was first laid on supports 6 ft. apart and subjected to a series of blows from a dropball weighing 1,400 lb., falling from a height of 8 ft. to 18 ft., without breaking. As a further test a heavier ball, weighing 4,765 lbs., was substituted, and a series of blows ranging from 13 ft. to 14½ ft. was delivered and still it was found that the frame had not sustained a fracture. It had, as a result of the treatment received, assumed a semi-circular formation, but there were no signs of breaking.

It was next stood on end, and subjected to some further blows with the heavier ball from heights of 6 ft., 9 ft., and 12 ft. respectively, still without exhibiting the least sign of a crack or fracture of any kind in the frame. Physical tests showed the material to have an elastic limit in pounds per square inch of 47,500. The tensile strength similarly calculated was given as 80,000; the elongation on 2 in. was 24 per cent., and the reduction of area 39 per cent.

As regards the chemical composition of the material, the constituents of which it was composed emboided various percentages of carbon, manganese, silicon, vanadium, phosphorus, and sulphur. The frame, was of the bar or open type.

BUILDINGS ON C.P.R. LAKE SHORE LINE.

THE contract for the erection of all the buildings on the new Lake Shore line of the C.P.R., giving a double track between Montreal and Toronto, has been let to the John Metcalfe Co. of Montreal, and it is intended to complete all the structures this year so as to have the line open to traffic.

Trenton is to be the divisional point. There a fine station is to be erected with a freight shed nearly a hundred and fifty feet long, enclosed tank with 40,000 gallons capacity, tool house, turn table, twelve stall locomotive house, machine and boiler house, coaling plant and all the necessary buildings required at a divisional point. The station will be of brick on concrete foundation, with slate roof, and be finished in natural wood. The majority of the stations to be built on the line will be of a similar design.

Drill Jig and Fixture Design and Construction

By H. R.

The sketches and data will, the writer hopes, appeal to machine shop superintendents, designers, toolmakers, and novices, as indicating the large place jigs of every kind and for every service occupy to-day in machine shop practice. The present article is the third of a series.

THE illustrations in this section of the series of articles deal with various levers, wheels, etc. As the standardization of parts is a most important item in jig and fixture design and construction, manufacturers should make up standards of their own, which would be fitting to their particular requirements. This would mean a great saving in the cost of production of jigs, etc. If a part of a jig gets broken, when standardized, the replacement can be usually obtained from stock.

No. 56 is a ball lever handle. This is particularly suitable for clamping the work in the centre of a jig, in conjunction with a stud bolt. The ball end is raised up in order to allow plenty of clearance to manipulate same with the hands.

No. 57 is what is termed a binder handle, while No. 58 shows a single-ended ball handle.

No. 59 is a double-ended ball handle or balanced ball handle. The last named, Nos. 58 and 59 are used in very special jig and machine tool work, such as the operation of slides and winding gear.

No. 60 is a suitable hand portion for the balanced ball handle.

No. 61 shows a small hand or thumb wheel. These are often made of cast iron, in various sizes, and can be used with great advantage in the place of wing nuts. A good pressure can be applied by the hand without the aid of wrenches. Sometimes it is well to screw the boss for other purposes.

No. 64 is a very common type of hand wheel. This can be also made from cast iron and the sketches No. 62 and 63 show suitable shaped handles for same; these being riveted into the rim of the wheel.

No. 65 is a well designed cast iron hand wheel, used extensively in large jig and fixture work.

No. 66 is what is called a horn handle. It will be clearly seen that same revolves on the centre spindle (A.) This spindle has a collar (B), and is riveted over to hold same in position. The spindle is also riveted into the lever (C).

No. 67 is known as a stop pin, and can be used in many examples of jig design.

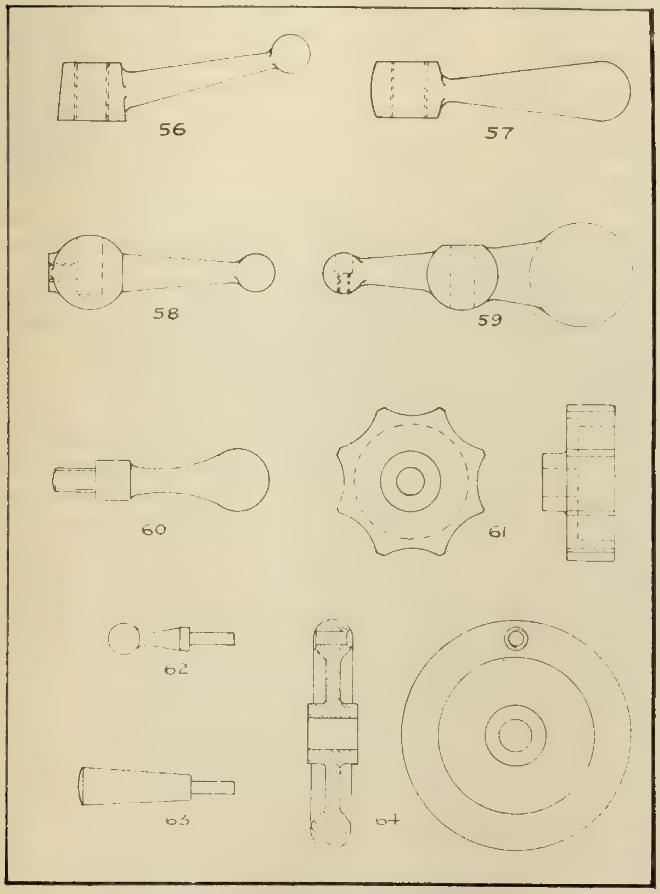
No. 68 is a hand wheel knob.

* * *

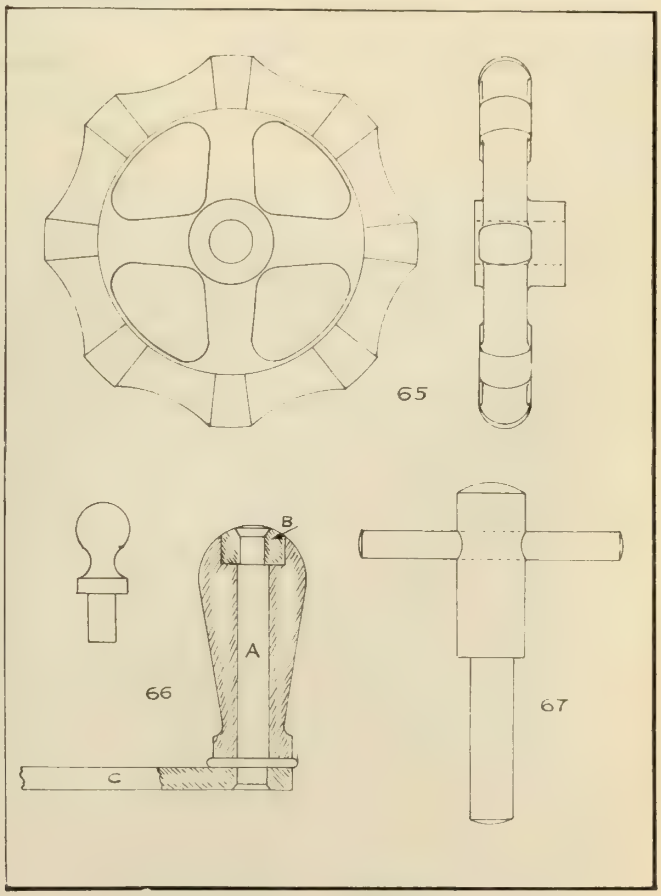
TAXES OF ONTARIO TOWNS.

A REPORT of the Ontario Bureau of Industries gives the taxes per head of the cities and principal towns of Ontario, as follows:—

	Population.	Municipal Taxes.	Total Taxes.
Port Arthur ...	14,106	$19.01	$25.10
Fort William...	20,644	18.69	23.38
Chatham	10,463	14.18	18.47
Ottawa	90.520	11.91	17.40
St. Catharines..	13,403	12.48	15.62
Toronto	374.666	12.07	17.15
Windsor	18,220	10.78	15.33
London	48.123	10.45	15.13
Brantford	24,084	10.56	14.56
Niagara Falls ..	9,004	10.07	14.20
Stratford	14,596	9.65	13.54
Berlin	15,338	9.01	12.87
St. Ste. Marie..	10,613	7.75	12.82
St. Thomas ...	15,240	8.73	12.77
Galt	10,333	8.48	12.52
Owen Sound ...	12.383	9.12	12.00
Hamilton	82,095	8.77	12.21
Belleville	10,440	9.18	12.30
Peterboro	19,300	7.12	11.60
Kingston	18,828	7.74	11.20
Guelph	15,107	6.28	10.08



DRILL JIG FIXTURES.



DRILL JIG FIXTURES.

POINTERS FOR YOUNG MOULDERS

BE sure there is enough metal in the ladle before pouring the job.

A good apprentice will make a good journeyman.

A number of smaller runners are far better than one large one.

Learn how to calculate the quantity of metal required to cast your work.

Always remember that it is to your advantage to be the best man in the shop.

Keep on good terms with the foreman if you wish to learn all branches of the trade.

Study the job before deciding where it shall be run, and where the riser shall be placed.

Apprentices cannot afford to lose the goodwill or friendship of anyone in their shops.

See that the metal has the clearest flow possible, when entering the mould at the runner.

Do not depend on a riser taking off any dirt; it does not do so. Be sure the mould is clean.

Be at your work first thing in the morning. You may get a superior job on that account.

Be sure that all clamps are sound, and that you have enough weight on the job to resist the strain.

There is no time to learn after you get the position, so begin to learn at once and give up guessing.

No man is fit for the position of foreman unless he knows how to calculate the metal required for a mould.

Do not let metal set in the bottom of the ladle; it spoils the chances of the next job poured from that ladle.

Always allow for runners and risers about 25 per cent. above the quantity of metal required to fill the mould.

Keep the mould joints clean, for a dirty or ragged joint is the forerunner of a run out and a possible waster.

Risers, or flowers, relieve the strain on the mould, and are convenient for feeding any heavy section of a casting.

Be sure the metal is in the right condition for pouring the job; for it is possible to cast a mould too hot as well as too cold.

When you have once made a job successfully, do not vary the method of making it, as in doing so you will be liable to make wasters.

Never allow yourself to think you have learned the entire moulder's trade, for one's knowledge can constantly be increased; no man has yet mastered the moulder's trade.

Do not unnecessarily loosen patterns, for, not only will you loosen parts of the mould, but the pattern will probably suffer damage. All patterns will not stand the hammer.

Castings for different purposes and of different design require different mixtures of metal and different treatment. Think of this, and be sure you are treating the job rightly.

Do not be wasteful in the use of the tools and materials supplied for your use. Your employer has to buy them, and the more he has to spend in this way, the less able will he be to give you an advance in wages.

Do not guess the amount of metal required, it is dangerous, and is the cause of many wasters. It is usually left to the foreman to calculate the amount of metal required for each mould, but there is no reason why you should not learn to do it also, for some day a leading hand or foreman will be wanted, and you should be prepared to fill the place.

Ask the foreman when you are in doubt. Don't "chance it." The foreman is responsible. — Foundry Trade Journal.

TECHNICAL EDUCATION.

SOME curiosity, says the Montreal Gazette, is beginning to be expressed as to when the Technical Education Commission will complete its report. The matter already deposited with the Government consists of four bulky parts, and it is now understood that yet further matter is under way. The Commission has now been in existence for upwards of three years.

Commission Purpose.

In this connection, attention has been called to a peculiar circumstance. When the Hon. MacKenzie King wrote on December 13, 1909, to the Premiers of the several Provinces broaching the subject of a Royal Commission, the letter included the following explicit statement: "It is intended that the Commission shall be solely for the purpose of gathering information."

Two of the Provincial Premiers accepted the proposal on the express understanding that the inquiry should be so limited. Sir James Whitney, in his reply, noted that it was to be solely for the purpose of gathering information, and said: "This being so, I see no objection to the creation of the Commission."

Sir Lomer Gouin, Premier of Quebec, wrote: "We are of the opinion, my colleagues and myself, that anything pertaining to public education—whether subject to special teaching or general teaching—belongs to the Provinces exclusively, and I want to write you so in order that there may be no misunderstanding on that point. As, on the other hand, you give me the assurance that the Federal authorities, in instituting a Commission of Investigation, would simply do it with a view to help the Provincial Governments by having collected information which they would later on put at the disposal of the latter, we see no objection."

When, however, the Order-in-Council constituting the Commission was passed, it went a step further, stating: "The information when obtained to be carefully compiled, together with such recommendations as it may seem expedient to the Commission to make." When the Commission reported, it recommended the spending of a sum of three millions.

In view of these circumstances, some doubt obtains as to when the report will be acted upon, or if in doing so there would be a breach of faith with the Provinces.

DETROIT RIVER CITIES.

FOR several miles on the right bank of the Detroit River, the city of Detroit occupies the shore continuously; on the left bank there are now five settlements: Windsor in the centre, on one side Ford City and Walkerville, and on the other Sandwich and Ojibway. Of these, Sandwich is the oldest, and Windsor is at present the largest. They are connected by an interurban electric railway, but they have no municipal organization or corporate life in common.

As a matter of business enterprise, the people of these different settlements have under consideration a co-operative publicity scheme, to be maintained in common, but to serve the corporate interests of each. This proposed co-operation naturally suggests the question why they should not unite to form one large city, and thus carry on all modes of urban activity under a single municipal organization. The site of this Canadian city would be equal to that of Detroit in extent and availability, and would be quite as interesting historically.

Walkerville, Ford, and Ojibway are essentially manufacturing centres now, but the new city would be or might be made an exceedingly attractive place of residence. With its fine river front and its adaptable hinterland it might become in a few years one of the great cities of Canada.—Toronto Globe.

The Publicity Policies of Our Canadian Towns and Cities

Staff Article

There are here set forth the parts played by the Industrial Commissioners, the Councils and Boards of Trade in securing new industries, and, incidentally, reference is made to the oftentimes stupendous nature of the latter task, the uncertainty existing right up to the actual signing of an agreement, and the obvious disappointment sure to be felt at unsuccessful effort.

TO a European, the idea of a town advertising itself is new. Across the pond, the only towns that advertise are health resorts. On the theory that the acquisition of a new industry by a town is profitable, it has been found advantageous on this continent to advertise the town's good points. There are so many people in the market looking for locations with good markets, good shipping facilities, and plenty of labor, that quite a rivalry has developed between the towns of North America in their endeavor to land new industries.

The Industrial Commissioner.

The work of attracting business of this kind falls to the lot of the town council, who, if the town be of considerable size and enterprising, usually employ what has come to be known as an "Industrial Commissioner," a man whose object is to lay the town's claims before manufacturers who are contemplating building factories. Usually he is a most aggressive individual, able to put up a good fight and with the town's attractions at his finger ends.

B. J. McCORMICK.
Industrial Commissioner, Welland.

The industrial commissioner must cooperate with the council, and vice versa, or he might as well get out. His position is no sinecure, and under the unusual circumstances, his salary is not always very large. His business is to secure new industries for the town, and if he does not succeed, there are aldermen in every council who want to know why. Usually, however, he can claim to have several hanging fire. The expenses incidental to such a department are usually very heavy, and it is up to the commissioner not to antagonize the council if possible. He will find that new industries are the most illusive things in the world. He can work day and night to secure them, and then when surely he has them in his grasp, they slip through his fingers and are gone. New industries cannot be grabbed. They can be courted, and drawn right up to the city's gates.

The industrial commissioner secures a site and figures, then puts the heads of the prospective industry into communication with citizens who can talk blandly, and after that, it rests with the council to concede to the demands of the company, prepare the by-law, and eventually land the new plant within the city limits.

There was an instance in Hamilton recently of an immense industry being se-

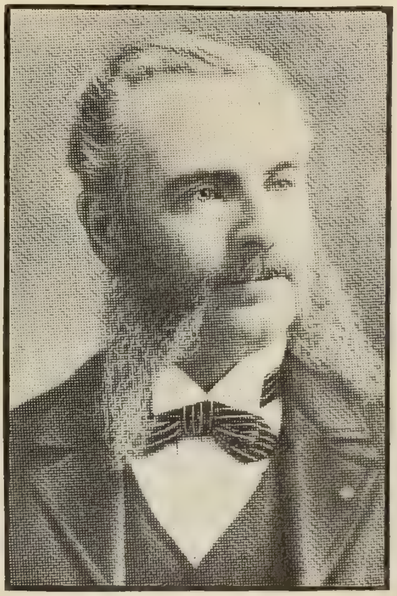
SHIPYARD, DRYDOCKS AND TOWN OF COLLINGWOOD, ONT.

cured by the merest accident. To the west of the city stands the plant of the National Steel Car Co., Ltd., which is now turning out twenty freight cars a day, and employing several hundred mechanics. About two years ago, the Montreal Daily Star published a story to the effect that a new industry would shortly locate in Montreal, to be known as the National Steel Car Co. A Hamilton manufacturer saw the account and remarked that there was no reason why his city should not have the industry. He got in touch with the industrial commissioner, who sent a wire to Basil Magor, the promoter of the concern. The latter promptly came to Hamilton to see what that city had to offer. He was satisfied, and without much more trouble this important industry was snatched from Montreal.. Some industries are not secured so easily. The Goodrich Rubber Co., Ltd., of Akron, Ohio, desired to build a large Canadian branch plant. Negotiations were opened with several cities, and it came to a tug-of-war between Windsor and St. Catharines. Both of these cities exerted every effort to secure this splendid industry, and Hamilton, who had not lost heart did her utmost still to bring it in. The news was wired across the country one day that the Goodrich people had chosen St. Catharines. A by-law was prepared, voted upon, and passed, but for some mysterious reason nothing more was done. A report was circulated later that the company had abandoned St. Catharines and was considering a site at Chippawa. The latest report is that for financial reasons, and because of a strike, the Goodrich Rubber Co. will not build a plant here for the present.

What this disappointment must have meant to the Industrial Commissioner at St. Catharines can be imagined when it is stated that this official is paid on a percentage basis, receiving remuneration only when the industry has been landed. In this case, the Commissioner is a real estate agent who gives only part of his time to the work. The same is true of Welland, and many other large cities in Ontario. On the other hand, the great majority of industrial commissioners are paid salaries from one to two thousand dollars a year, have an office in the city hall, and devote the whole of their time to this work.

No Royal Road to Success.

There is no royal road to success in this profession. Strenuous work is necessary, and plenty of tact. No two propositions are handled in the same manner. Once a concern has been interested, it is necessary for the commissioner to get quickly to work to secure facts concerning ready-made factories or sites which might be suitable. If the building is not just right, he must be ready with the authoritative statement that it can be altered to suit the manufacturer's requirements. The commissioner must be on good terms with the manufacturers already located in this town, and be in a position to call on them for help when necessary. A very busy manufacturer came over from the States recently, who wanted a ready-made factory in a very short time. He is now manufacturing in a certain Ontario town. When he went there first, he intended staying for about an hour, but the commissioner put him in touch with such interesting men, he stayed for a day, and eventually established his plant there.



E. K. BARNSDALE,
Chairman Industrial and Railway Committee, Stratford, Ont.

It might be remarked here that this man first came to the office of "Canadian Machinery." He was known as a maker of hack saws, and required a one or two-storey building, having about 8,000 square feet of floor surface, convenient to railways. Immediately, letters were addressed by that journal to industrial commissioners all over the province, some of whom replied long after the industry had been placed, and some not at all. True, it was only a small plant, but, nevertheless, one which will develop being a branch of a large American industry. The smallness did not prevent the most progressive city in Canada going after it, tooth and nail, and securing it.

In marked contrast to the apathy of some of the larger cities was the attitude of a number of smaller towns. The Board of Trade of Acton, Ont., made a bid for it, and did not cease negotiating until the industry had been placed. Calgary, which was out of the running in this case, owing to its western position, kept the wires busy with its call to this American manufacturer to come west. Here is the Commissioner's businesslike wire:—

"Please advise American firm establishing Canadian branch that City of Calgary offers required floor space in reinforced concrete industrial building, rental 30 cents square foot per annum. Building most modern on continent. Gas twenty cents per thousand. Hydro-electric power one cent per kilowatt

Zam-Buk
HOTEL
DRUG Co

VIEW OF MAIN STREET, WINNIPEG, MAN.

hour. Big market of middle Canadian west accessible. Splendid opportunity. Writing."

Industry Ambition Commendable.

The ambition displayed by some Canadian towns and villages which have never yet known the delight of a good-sized industry is very commendable. Last week the small town of Bradford, Ont., voted on a by-law to grant certain concessions to a manufacturer who will erect a plant for the manufacture of wire screws, and passed it almost unanimously. The citizens were so jubilant, a torchlight procession was held the same night, and the town was en fete to celebrate the arrival of its new industry.

Man-in-the-Street a Booster.

The man-in-the-street is a booster. He seems to have a deep conviction that to grow, his town must get new industries, although on the whole, their acquisition may not enrich him one iota. The writer was chatting with a teamster at Port Dalhousie, Ont., some weeks ago. and made some enquiries regarding the town's industries. The teamster, thinking he was talking to one looking for a site, commenced to hold forth on the unrivalled advantages of Port Dalhousie, its splendid situation at the mouth of the Welland Canal, etc., and concluded by handing the writer over to a town official.

Small Towns Handicapped.

The small town, however, is "up against it" as regards new industries. It has got to have the goods, and must offer unusual inducements before it can get a start. The unfortunate thing is that industries which go abegging to small towns are not, as a rule, the best, and the town which grants big subsidies is liable to find itself "stung." There are notable exceptions, however.

Attention might be drawn to Brampton, Ont., which during the past two years has developed from a small country town into a thriving manufacturing centre. Among other industries, it has the largest furnace foundries in the province, and has arranged for a large engine works. Aurora might also be pointed to as a town which has lately attracted several good industries. The chief argument advanced by these two towns is their proximity to Toronto, and its big market. Then there are lower taxation and cheaper sites to be considered, points that count in favor of the small town.

The Board of Trade Feature.

Apart from the city council and the industrial commissioner, there is another factor in civic progress and prosperity that is equal in importance to each of the foregoing—the Board of Trade, an institution to be found in every Canadian town that has passed the village stage. This should and usually does consist of a body of business men, incorporated for the purpose of promoting measures for developing the general trade and commerce of their town and province. These are men who have lost faith in the old cut-throat methods of doing business, who are broad-minded enough to appreciate the other fellow's suggestions, and are willing to disseminate their own ideas for the benefit of competitors. They are men who devote their time for the betterment of the business community, possessing civic pride, men who devise ways of upbuilding a strong commercial and industrial structure.

It follows then, that the Board of Trade will have for one of its objects the bringing of new industries into the city, and that perfect harmony should exist between the Board, the City Council, and the industrial commissioner. Unfortunately, this is not always the case, resulting in chaos. In a city where the Board of Trade and City Council pull in opposite directions, new industries cannot be expected; where they work in harmony, they contain all the essentials for attracting new business.

Advertising the Town.

Among other things, the Board of Trade usually makes it its business to compile a booklet setting forth the status of the city, so that manufacturers may see at a glance what conditions obtain there. Being business men, they appreciate the value of advertising, and would carry it further if they were only seconded in their efforts every time by the City Council. As it is, their efforts in this direction usually end with a booklet, whereas greater effect might be produced by advertising in the pages of a magazine which reaches the eye of manufacturers.

The literature sent out by Boards of Trade and Industrial Commissioners often shows lack of funds and lack of discretion. To attempt such a crusade, money is necessary for several publications. The first should be an artistic volume, giving a pictorial review of the city, the reading matter taking second place. This should be supplemented by one or two leaflets which state tersely, and in a businesslike manner, the attractions the city possesses. The City of Hamilton has for three years published a book called "The Hamilton Manufacturer," which includes articles on Hamilton written by prominent men, and illustrated with clear photographs. Art paper is used, resulting in a publication worthy of the city from which it came.

Camera Glimpses.

"Camera Glimpses of Port Arthur," arranged by N. G. Neill, ex-industrial commissioner and now of North Battleford, is another example of effective literature along this line. By looking at this, the manufacturer can see at a glance that Port Arthur is no small town. Ottawa has issued a very sensible booklet, containing the correct amount of reading matter, and the facts stated plainly. No manufacturer can be expected to delve into a book of uninteresting matter relating to sports, the town band, and what part the district played in the war of 1812.

MONTREAL HARBOR FROM GRAND TRUNK ELEVATOR.

A commissioner should not be afraid to go outside to secure a good printer for his publicity literature. In many cases the local printer is a bad advertisement for the town. We have received a booklet from a British Columbia town, the first page of which is in the middle, and makes a start with page 13. This is a home product which will amuse the manufacturer. Another western city sent us literature which was a positive pain to read, the accompanying maps and illustrations being cheap and undecipherable.

Such criticism cannot be levelled, however, at every western city. The official handbook issued by Weyburn, Sask., will put many Ontario towns to shame, and Calgary, which must spend an enormous sum on publicity work, has adopted several neat and attractive ideas in its literature. Winnipeg of late has adopted a system of diagrams illustrating the city's growth in ten years, the growth in the number of buildings, in the annual bank clearings, and in the output of its factories. While such a scheme is anything but artistic, it shows at a glance the gigantic leaps Winnipeg has made since 1900.

Hamilton's Official Handbook.

After looking through a pile of such literature sent from all over Canada, the official handbook issued by the City of Hamilton seems to us to embody the facts required by a prospective manufacturer as they should be stated. It begins with a short description of "The Industrial City" in clear type, on good paper, facing a bird's eye view of the central section of the city. The next page is devoted to street scenes, which are excellent, and the opposite page to "Facts About Hamilton." Then follow two pages containing small views of Hamilton's industries, statistics, and brief statements regarding raw material, labor, shipping facilities, freight rates, electric power, the home life, distances from American cities; a list of plants of United States parentage; educational facilities, and civic government. All this is told in very few words, with many photographs.

Bonusing Firms.

We now come to a phase of publicity policy which has come prominently into the limelight lately, and on which "Canadian Machinery" has expressed itself strongly editorially. Reference is made to the practice of giving bonuses to firms who guarantee to erect a plant in a city, within a certain period, and to employ a specific number of men. The practice has become so common now that it is almost impossible for a town to secure an industry on its merits. To succeed, a town must be prepared to guarantee the bonds of a concern, or to loan them a sum often as high as from $100,000 to $200,000. The ratepayers, in their anxiety to have a big plant in their midst, having full confidence in the capacity for business of their civic rulers, and after being assured beyond question by the local Press that the scheme is bona fide, vote favorably on the measure, and mortgage their interests for the next ten years, taking a chance on an industry that may be run by a bunch of nincompoops. In some cases, the business fails, and the onus falls on the innocent ratepayers, who must pay through the nose in the form of taxes.

Not only is a loan demanded, but it has become a recognized custom for a new concern to demand a site on which to build the plant, as well as tax exemption for a number of years, together with dirt-cheap water and power.

This system of bonusing is the weapon in the hand of the smaller cities, which is attracting firms from the larger centres. There are cities in Canada to whom it would be ruinous to adopt a system of handing out sites to every industry that came along, and who are not amenable to the custom of lending money.

A splendid system has been adopted by Windsor, Ont., which is similar to that existing in Indianapolis, except that the latter is run by a private corporation. In Windsor, the city secured the best property available at the lowest possible cost, made all necessary improvements, and then offered it to manufacturers at the original cost of $500 an acre. This property has connection with all the railways by a spur line, and is only three blocks from the main thoroughfare. Windsor offers this to manufacturers employing at least twenty-five hands; exemption for ten years from taxes, other than school and local improvement rates, which no city can remit. Free water for ten years, and free light for ten years, beginning from the time that Windsor gets Niagara power. Nothing is said about a loan, and it is plain that the manufacturer must pay for his site.

Few cities are as frank as Windsor, and do not state as a rule what inducements they are prepared to offer in their publicity literature. Like Midland, Ont., they intimate their intention of giving things in the following way:—

"To this end a liberal policy in the way of municipal concessions to prospective manufacturers and industrial concerns has been decided upon by the council." No manufacturer knows what he is able to extract from a city council until he has laid his proposition before them. If it comes to a fight, then things will be going cheap.

Peterborough, Ont., encourages the location of industries, depending upon their size. London, Ont., gives free sites, cash bonuses, and fixed assessment of about 25 per cent. St. Thomas council are offering inducements on certain conditions. Brantford gives a fixed assessment for ten years. Welland offers a free site, a fixed rate of taxation for ten years, and city water at 5 cents per million gallons for manufacturing purposes, which is the cost of pumping. Woodstock, Ont., is prepared to offer free sites, water, power and light at about cost, and fixed assessment. Calgary, Alta., while opposed to the bonusing of incoming manufacturers, provides sites, light, power and water at cost, and gives exemption from taxation on plants and buildings where 25 hands or over are employed.

This policy of encouraging industries by means of bonuses is not confined to Ontario by any means. Much bigger subsidies might be secured in other provinces, were the geographical situation satisfactory. There are many concerns coming to Canada that hold their hands up at the mention of bonuses. They come here in search of a logical location, and that is first and foremost in their consideration. Depend upon it, the town where such firms locate, is a town with unusual advantages.

* * *

SETTLERS FOR THE EASTERN PROVINCES.

THE C.P.R. is actively prosecuting its campaign for attracting settlers to the Eastern Provinces, as well as to the Western lands of the Dominion. A small handbook containing lists of improved farms available for settlement in Canada's Eastern Provinces has just been issued. The publication of this handbook is the first step in an active campaign to be undertaken by the company under the direction of Mr. J. S. Dennis, assistant to the President, and head of the Department of Natural Resources, with the object of placing settlers on the vacant areas throughout the Provinces of Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island.

"We are daily receiving inquiries," says one of the officers of the company, "from intending settlers who express a desire to take up farms in the older settled provinces of the Dominion, or who have friends and relatives already living in the East and desire to settle near them, and it is with the object of placing reliable information in the hands of these people that this handbook has been published. The lists of farms contained in the booklet have without exception been obtained through the medium of the several Provincial Governments concerned, and it is the company's desire to co-operate with the Governments of the Eastern Provinces in the placing of settlers on these farms. It is our intention to distribute about five thousand of these booklets throughout Great Britain, and also a large number through our agencies in the United States."

The Shipbuilding Plant of G. T. Davie & Sons, Levis, P.Q.

Staff Article

In this article particular prominence is given to the equipment installed at the Davie Plant, and to the firm's ability to handle large and heavy marine repairs; the S. S. Wabana being a typical example of the latter.

ACROSS the River St. Lawrence from Quebec, a little east of Levis, is a quaint two-storey frame building. The upper storey is a residence, and the lower floor an office. Over the doorway of the latter is a sign which reads: "Patent Slip Office." This refers to an antiquated slip erected seventy-five years ago for doing all kinds of repair work on wood and iron ships up to 150 feet keel. Anchored nearby is the recently launched Canadian Government Hopper Barge No. 1, of 850 tons. The question that naturally arises is, "Where are the shops?" These are at St. Joseph de Levis, several miles eastward, near the Government dry dock. The "patent slip office" is the headquarters for the shipbuilding firm of Geo. T. Davie & Sons, Levis, P.Q.

Importance of the Firm.

Interest has been centred in this firm of late, because of the hopper barge which they are completing for the Government, and of the fact that they have just completed a repair job on the s.s. Wabana, a vessel of 5,000 tons register, which went on the rocks at Fame Point last May. This vessel was 32 days in the repairers' hands, out of which five Sundays must be deducted. In that time 135 plates were handled, 100 of which were badly buckled and broken, and 50 per cent. renewed.

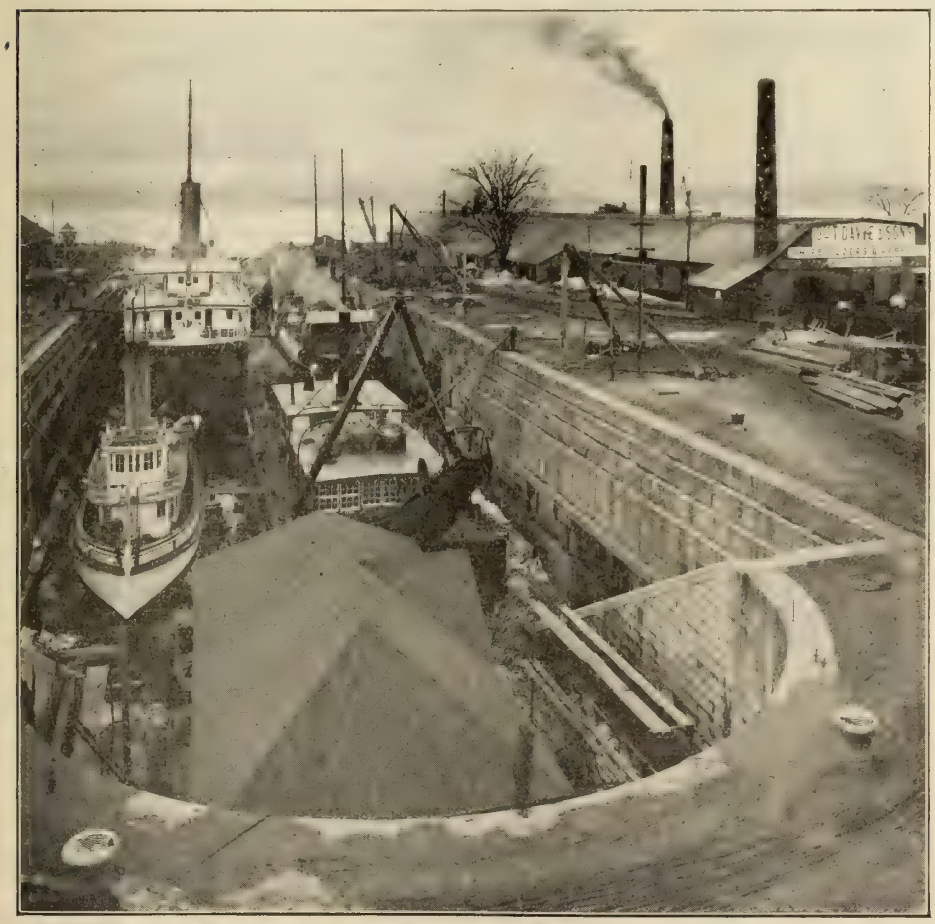
S.S. "Wabana" Repair.

The "Wabana" was on charter by the Dominion Coal Co., Montreal, when she went on the rocks. She was, however, able to come up the river to Montreal, where she discharged her cargo of coal. It was then suggested that the ship be placed in the new Montreal floating dock for repair, but the underwriters sent her back to Quebec.

Surveyors and experts were called in to examine the ship, and tenders were called for her repair.

A New York firm put in a tender, as did Geo. T. Davie & Sons, and the latter were awarded the contract. The steamer was placed in the Levis dry dock for permanent repairs, superintended at the start by Mr. Blackett, chief of the London (Eng.) Salvage Co., and afterwards by Mr. Henry Black, expert engineer and Lloyd's surveyor at the port of New York. The Wabana is quite a new ship, being only 15 months old when she went on the rocks.

THE OLD SLIP.



DRY DOCK AT LEVIS, QUE., SHOWING VESSELS WINTERING.

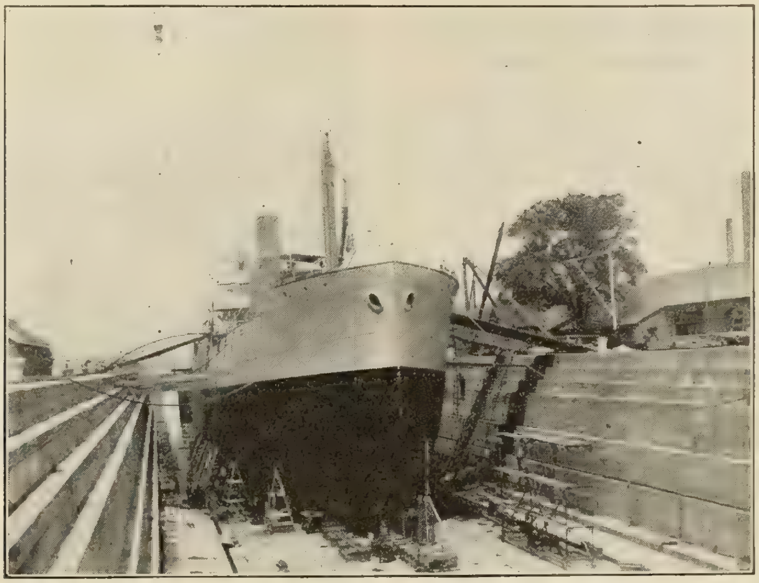
It is remarkable that the repairs could be done in such a short time, especially when it is considered that the movement of all the material had to be done by hand. The dock is devoid of any travelling cranes or even capstans, and the pumps of the dock are so obsolete that it takes 15 hours to pump the water out, in comparison with 3 hours in other Atlantic dry docks.

Plant Features.

From a glance at the illustrations and a study of the following description of the shipbuilding works located alongside the dry dock, it will be seen at once that the plant is considerably hampered by the need of proper facilities for handling the work between the shops and the vessel. The derricks shown in the illustration seem hardly capable of handling work required for anything like the Wabana contract.

In the shops there is a powerful air compressor, with the necessary receivers and permanent pipe line to dock bottom; also a complete up-to-date outfit of drills, riveters, rammers and other necessary air tools for expeditiously handling repairs to steel or iron steamers. There is a portable compressor which can be moved quickly to deal with repairs to vessels at the different docks and wharves, while loading or discharging cargo.

The plant contains a complete outfit of differential pulleys, hydraulic blocks for tail shaft and propeller work, and a floating derrick capable of lifting and moving loads of from fifteen to twenty tons. The shops, vessels and docks are lighted with electricity. There is also telephone communication between the main office at Levis and the works and docks, enabling touch to be kept with all departments, thus securing prompt despatch on all repair and other jobs.



S. S. "WABANA" IN DRY DOCK AT LEVIS, QUE.

The firm has purchased from A. W. Smith & Son, Limited, Glasgow, Scotland, and installed in their shops, a set of rolls, capable of rolling plates up to 26 ft. 6 in. long, and of any width and thickness in use or likely to be used in steel shipbuilding; one cam and lever wide gap punch, with powerful cranes to handle plates 30 ft. long, 7 ft. wide and 1 ft. 6 in. thick. They have also purchased from the same firm a combined horizontal beam bender punch and shaper, capable of curving beams of any section used in shipbuilding, and forming channels, tees, etc., to any reasonable angle, thus eliminating expensive angle smith work. There is also a Cameron, Manchester, cam and lever punch, shear and angle cutter, capable of dealing with plates up to 1¼ inches thick, and cutting angles 7 x 7 inches.

Among the equipment there are also a double-ended punch and shear, made by Barry's, Sowerby Bridge, England, which will punch up to 1 inch in thickness, and a portable punch for casing work on ship decks; a heavy set of Cameron rolls for plates 16 ft. long; a plate planing machine, by the same maker; a Shank's keel bender; a Barry horizontal punch and beam bender, and two Hetherington, Manchester, patent swing countersinking machines.

The plate furnace is capable of dealing with the largest plates in general use. The angle furnace is up-to-date, with a large bending block area, enabling stern bars to be curved up to 70 ft. long. There is a side lever cold saw, for cutting butts off garboard plates, with all the necessary gear for quick manipulation. In the engineering department there is a large multiple drill for stern frame work, with other drills for lighter work. In addition to the foregoing, there are shaper and scarphing machines, lathes, planers, and other machine tools generally associated with marine and general engineering plants.

In the blacksmith's department there is a Shank's steam hammer with 24 in. lift, two rivet making machines, and the usual outfit of a first-class forge. Material carried in stock, including plates, angles, bulb angles, channels, tees, rounds, half-rounds, squares, etc., is very large. Keel and stern bars, chequered plates, and every section that the last twenty years of shipbuilding has made necessary, are kept on hand. Large quantities of rivets of suitable sizes, all of which are certified by Lloyd's Register of British and Foreign Shipping, Bureau Veritas, or other classification, are also kept in stock.

* * *

W. H. ALLEN, SON & CO., TESTING PLANT.

W. H. ALLEN, SON & Co., of Bedford, England, who do a large business in Canada in high speed engines, centrifugal pumps, etc., have remarkably complete arrangements made for testing the product of their works. There are five Babcock and Wilcox land type boilers with superheaters, one having a full load capacity of 20,000 lb. an hour, and four of 6,000 lb. an hour each. The large boiler is fitted with a special type of superheater damper, by which the amount of superheat can be varied. The draught is induced, cold air being driven upwards through the throat of the chimney by a steam turbine-driven fan. All the boilers are hand-fired with Welsh steam coal, experience having proved this method the most satisfactory, when rapid fluctuations in load have to be dealt with.

In the testing department are beds for the temporary fixing of steam engines and dynamos, and steam and exhaust mains are carried along the entire length. For testing centrifugal pumps, a covered-in tank with a capacity of about 28,000 gallons has been provided with four Venturi meters and gauges. The equipment for the testing of centrifugal fans includes a special air trunk and differential draught gauge.

LABOR DISPUTES IN JULY.

ACCORDING to the record maintained by the Department of Labor, industrial conditions showed an improvement with regard to labor disputes during July. There were 24 in existence as compared with 27 during the previous month.

A still greater improvement is seen by the comparison made with the corresponding period of last year, when there were 46 strikes and lock-outs existing in the Dominion.

During July, 1913 about 152 firms and 8,000 employes were involved in strikes and lock-outs as compared with 450 firms and 11,957 employes affected by trade disputes during the previous month. There was a slight increase in the loss of time to employees, about 188,000 working days being lost, as compared with approximately 181,000 during June.

It may be mentioned that during July, 1912, upwards of 270,000 working days were lost from this cause.

Two disputes of importance occurred during July, while of those that were in existence previous to this month, the most important as affecting industrial conditions, were those of coal miners on Vancouver Island and saw-mill hands at St. John, N.B. These two disputes together accounted for a loss of upwards of 130,000 working days.

DRILL JIG DESIGNING.

By A. L. Monrad.

TOOLmakers and designers often overlook the most important parts in designing and making drill jigs for the production of interchangeable parts from an economic viewpoint, and yet if someone had posted them in proper time, the result would have been a marked increase of accuracy and efficiency of the jig.

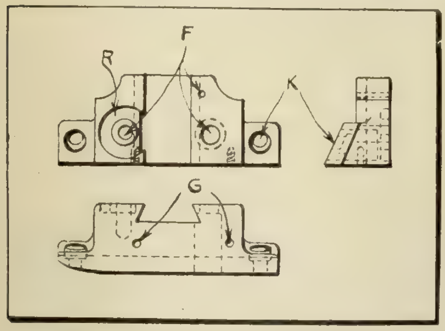

FIG. 1.—DRILL JIG DESIGNING.

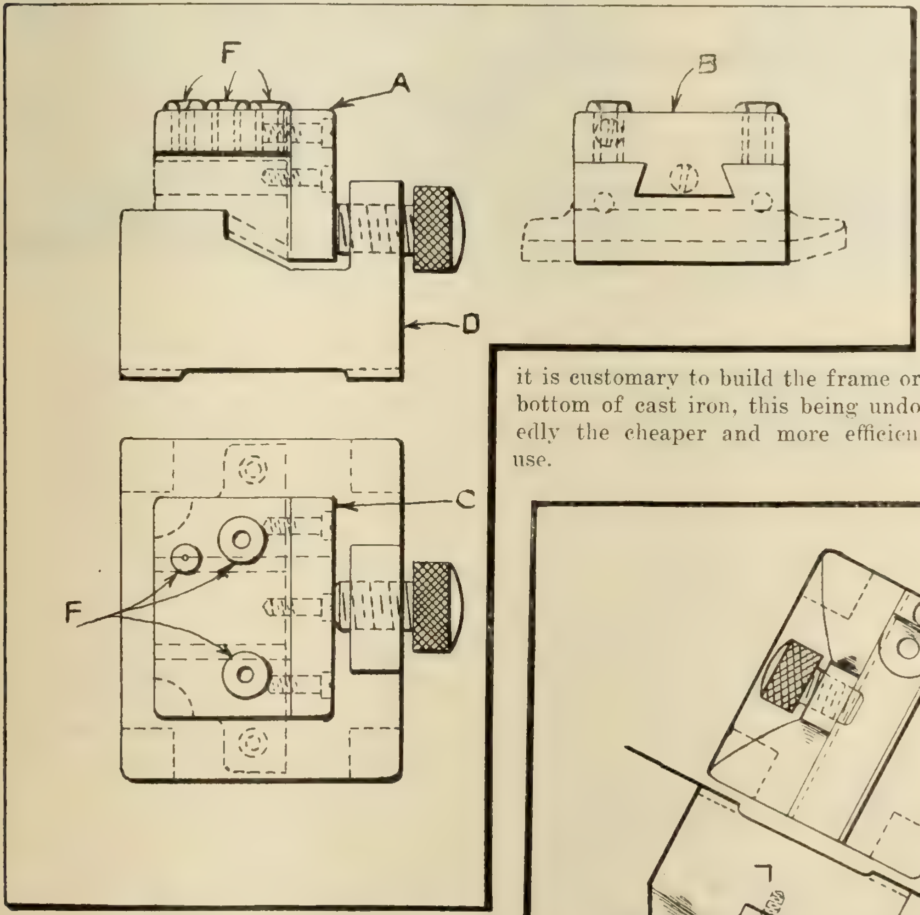

FIG. 2. DRILL JIG DESIGNING.

A good designer keeps constantly in mind: That the maximum amount of work must be produced in the shortest operating time, with the least amount of labor, and at the lowest cost. Achievement of the foregoing is very seldom attained, even if the designer has the power right in his own hand. Many still hang to the old ideas that a jig ought to have a handle, and a large base area for legs, both of which increase the weight of the jig, and make it harder to handle, besides being very unsafe practice should the drill suddenly "take hold."

Much has been going on among jig designers lately as to using cast iron legs instead of hardened tool steel legs. From an economic standpoint, cast iron legs wear as long as tool steel on small light jigs, and even on larger jigs, if proportional bearing surface has been provided, it outwears the jig in many cases. Where cast iron legs are used, it is customary to build the frame or the bottom of cast iron, this being undoubtedly the cheaper and more efficient to use.

Drill jig bushings are as a rule made of tool steel hardened in bran or salt water. They are then ground outside and inside. The hole is lapped to a turning fit of the drill to be used. The length of bushing bearing should equal that of head of spiral of drill. The upper part of bushing hole should increase its diameter to prevent the drill binding on account of excessive bearing. The entrance hole in bushing should be considerably rounded for an easy entering of the drill, and the bushing should also have large diameter of head to prevent mutilating the jig body or lid. The outlet of bushing hole should also be rounded so as to shed the chips. A groove is cut in under the head of the bushing so that when grinding the outside diameter, the wheel will not have to corner. The lower end of the bushing diameter should be a little tapered to drive in easy.

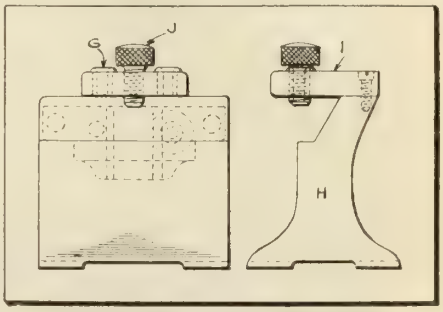

FIG. 3. DRILL JIG DESIGNING.

In the clamping device of a drill jig do away as much as possible with duplicate pieces or connections, especially

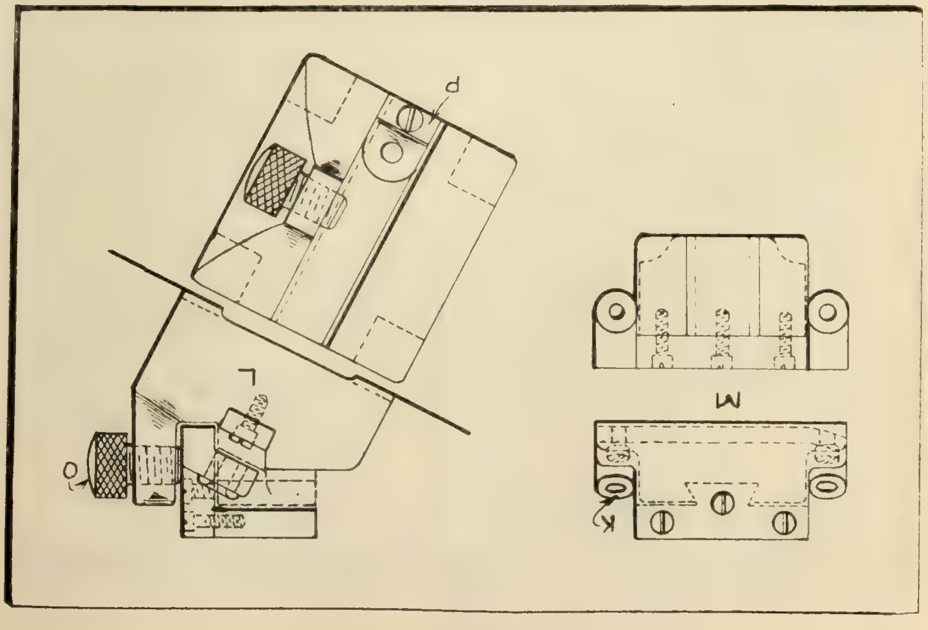

FIG. 4. DRILL JIG DESIGNING.

where one of these will accomplish the same result, such as one screw or cam motion. A drill jig lid generally hangs on a taper pin, having a driving fit on each side of frame, and a turning fit on the lid, in order that the hinge may be compensated for and the resulting inaccuracy due to the lost motion in the lid be prevented. An oil groove is milled in the middle of taper pin for lubricating the hinge after the pin is driven in, and screw for locking purposes in a jig should be so located that it will not tilt the work to one side or the other.

It is very essential that the screw pressure should be in a direct line so as to have equal metal on each side of the centre line to prevent tilting and provide thrust in such manner that it will be resisted by solid metal. The designer and operator very often underestimate the power of a screw, with the result that the work springs and if drilled under these circumstances results in spoiling the accuracy of operation.

There is described and illustrated in Fig. 1, a very simple jig design, with screw device for clamping, to drill seven, and counterbore two holes. This is known as the block system, because all the jigs are placed in a cast iron block during drilling operation. The model has been machined all over and is interchangeable. The tap holes in model are first drilled with jig Fig. 2. The drill jig proper (A) is made of second grade tool steel, hardened. The dove-tailed part (B) has been made a sliding fit in the model, and is held to a stop plate (C) by three cap screws. Two stop pins are provided between the work and stop plate (C), to locate the work properly, and at such a height as to keep all chips away from the work.

The jig is now placed on the cast iron block (D) which has four legs planed on the bottom. By turning the screw (E) the work with the jig is held firmly in position while drilling the three holes (F). The two holes (G) on the side of the model were drilled as shown in Fig. 3. This is a solid jig, made of cast iron, with a steel bushing plate (I) on top held with two screws. By having the work slide up to a stop pin and bottom in the angle of drill jig at same time turning the knurled finger screw (J), it is secured in position and is ready for the drilling operation. The two end holes (K) are drilled as shown in Fig. 4. This also has the dove-tailed slot in the model, also two ears extended, one on each side on the same angle as the model. A cast iron block (L) is made so that when the jig (M) is in position, the bushing stands at right angles with the drill press table. A turn of the knurled screw (O) brings the jig into a secure position. A curved steel piece (P) is located on the end of jig with a screw, and acts as a seat for the curve in the model when drilling, also as the stop with the screw extended above.

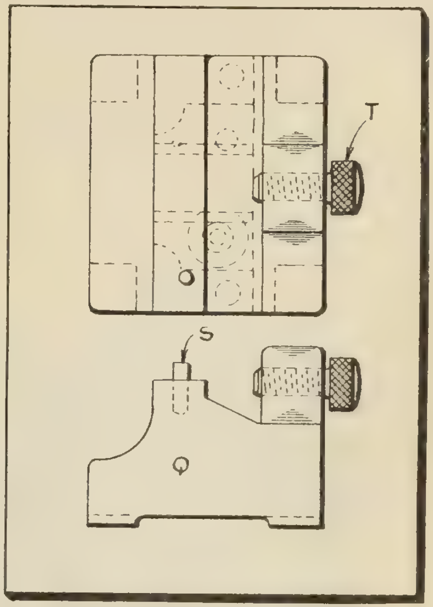

FIG. 5. DRILL JIG DESIGNING.

Fig. 5 is a cast iron block jig (Q) for holding the work while hollow milling hole (R). By placing the work against the stop pin (S) and turning the knurled screw (T), the work is secured in position while hollowmilling.

Fig. 6 is very similar to Fig. 4, only the groove in the centre is nearer in order to accommodate the work, and without the jig for counterboring the head holes (K).

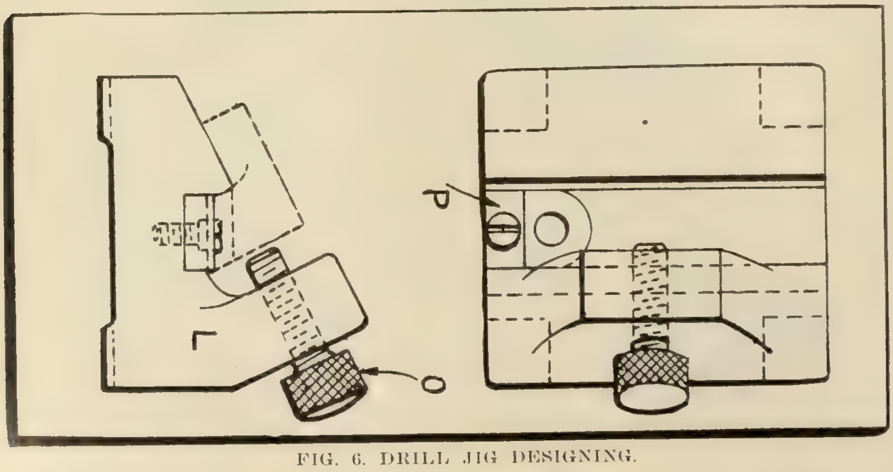

FIG. 6. DRILL JIG DESIGNING.

CIVIC PUBLICITY.

By H. M. Marsh,

IN these days of specialists and applied effort, it has been demonstrated that those who want to keep in the van of progress must adopt the most improved methods. Most municipalities have what is termed an Industrial Committee composed of representatives of the City Council and prominent business men whose duty it is to entertain visitors seeking information regarding industrial possibilities. However "what is everybody's business is nobody's business," and as all of these men are generally very busy men, and can scarcely afford to give any time from their own business, the imparting of information to inquiries from the United States or other Canadian Cities is often improperly attended to. This was the condition of affairs in Hamilton until about two and a half years ago, when it was decided to appoint an official who could devote all his time to properly setting forth the advantages of Hamilton, and who would have under his particular charge the task of inducing industries to locate here.

That the appointing of an Industrial Commissioner has been justified has been demonstrated by the results shown during the last two years. The Industrial Department has been instrumental in securing for Hamilton some thirty new industries representing an investment of over six million dollars. Among the largest industrial acquisitions may be mentioned: The Oliver Chilled Plow Works, of South Bend, Ind.; National Fireproofing Co., of Pittsburg, Pa.; Canada Steel Co.; Standard Underground Cable Co.; Boston Insulated Wire Co., Boston; Schacht Motor Car Co., Cincinnati; Grasselli Chemical Co., Cleveland; Dominion Steel Castings, Ltd.; National Steel Car Co. The bulk of the capital is of United States origin, so that Hamilton to-day occupies the proud position of having more American capital invested in industrial pursuits than any other Canadian city.

* * *

The International Harvester Co. which closed its plant a couple of weeks ago, announced on August 18, that it would resume operations on September 2, with a staff of about 1,500 men. The Oliver chilled Plow Works, which has also been shut down, is preparing to open up again about the same time. This is very welcome news to an army of idle workingmen in Hamilton.

CANADIAN MANUFACTURERS CONVENTION.

PLANS are now practically complete for the big excursion which the Canadian Manufacturers' Association will run to Halifax next month in connection with the Annual Convention of that organization which will this year be held in the Nova Scotian city. It is expected that some fifty Montrealers, many of them accompanied by wives and families, will make the trip, while altogether there will be some two hundred delegates from Quebec and Ontario. A number of Westerners will also attend. The itinerary has not yet been completed, but it has been decided to visit St. Andrews on the way down and later to proceed as far as Amherst and New Glasgow.

Convention Features.

The convention will last for three days, September 16, 17, and 18, and the excursion will probably leave Montreal on the morning of September 14. Reports from Halifax state that great preparations are being made to entertain the visitors. The civic reception and a trip around the city and harbor will figure prominently. The local council of women is making arrangements to entertain the lady visitors while the men are attending business sessions. A motor trip around the harbor and a theatre party are two items of the programme.

The annual banquet will take place on the night of September 18. The Premier has been invited to attend, and has stated that while he can as yet give no definite promise he anticipates being present. Sir Wilfrid Laurier has also been invited, and, if he cannot be present in person, it is likely that he will send a representative, so that both political parties will be officially represented.

A number of interesting questions, chiefly in connection with transportation problems and tariff difficulties, will come up for discussion.

CANADA IRON CORPORATION.

APPLICATION was made to the courts on August 21 by the Canada Iron Corporation for the appointment of a receiver, under whose direction the affairs of the corporation will be conducted pending a reconstruction of its finances. The application was granted, and F. F. Whyte, of New York, was named as the receiver.

The decision to apply for a receiver was reached at a meeting of the Board of Directors last week, and it was stated on behalf of the directors that since the expiration of the bounties reduction in profits had seriously hampered operations. The directors have decided that the only course open to them is to reduce their fixed charges by a reorganization of their finances, and the receivership is preliminary to a reorganization plan which is now being formulated.

The company is what is known as a close corporation, its stock not being listed on any exchange. Its 6 per cent. bonds, however, have been listed in London since 1909. The company has mines at Eganville and Bessemer, Ont.; Bathurst, N.B., and Torbrook, N.S. Its furnaces are situated at Midland, Ont.; Radnor and Drummondville, Que.; and its foundries are at Fort William, Hamilton, St. Thomas and Midland, Ont.; Montreal, Three Rivers and Londonderry, Que.

The head office of the concern is in Montreal, and the directors are: Thomas J. Drummond, Montreal, president; George E. Drummond, Montreal, vice-president; Edgar McDougall, Montreal, vice-president and general manager; A. E. Dyment, Toronto; H. Cockshutt, Brantford. There is also a directorial committee in London.

GEAR CUTTING ATTACHMENT FOR THE LATHE.

By J. H. W.

THE gear cutting attachment here shown was designed and manufactured by John Fee, who has a well appointed machine shop at 107 Lagauchetiere Street W., Montreal. While embodying no new principle, the device is a good example of what such an attachment should be. It is inexpensive to make and combines simplicity with efficiency.

Referring to the cuts, Fig. 1 shows the attachment assembled on the lathe, with a completed gear wheel in position on the mandrel. The indexing head (A), taken from a milling machine, is carried by the cross slide (B) seen in Fig. 2. The latter is elevated by the square threaded screw (C). Chatter of the work is prevented by the thrust screw (D), the point of which is brought up against the back of the gear blank, and there locked by the lever nut (E). The bracket which forms a nut for this screw (D) is, of course, adjustable vertically to suit various diameters of gear blanks.

The base of the apparatus is clamped to the lathe bed in the manner shown in the cuts, and the upper part is traversed across by a screw operated by the handwheel (F). The gear cutter is carried on an arbor between the lathe centres in the usual manner.

Since these photographs were taken, a dividing head has been fitted at the end of the elevating screw (C), enabling the depth of cut to be determined without direct measurement.

A gear 46 inches in diameter can be cut on this attachment, which has paid for itself many times over. It would, of course, be a comparatively simple matter to fit such a device with a power feed if thought desirable.

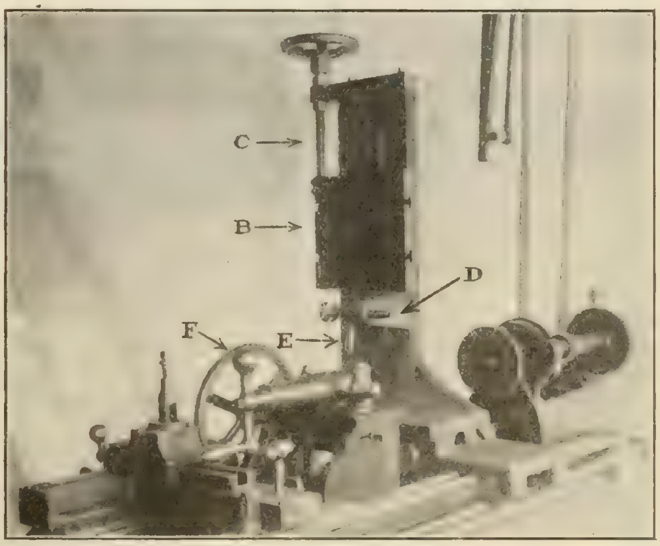

FIG. 2. GEAR CUTTING ATTACHMENT FOR LATHE.

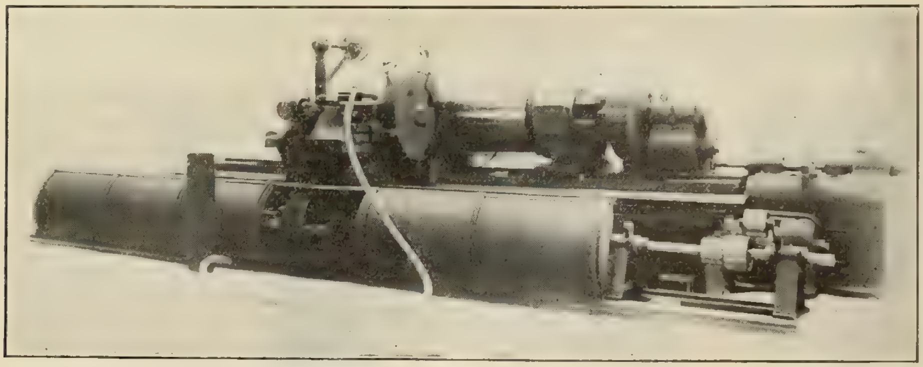
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

A NEW ROLL GRINDER.

THE grinding machine, here illustrated, embodies the Landis Tool Co.'s distinguishing principle of traversing the grinding wheel carriage, which is a fixed weight. The advantages of this principle are:—

1.—Unvaried duty imposed at all times upon the carriage driving mechanism, insuring accuracy of traveling distance between points of reversal.



LANDIS ROLL GRINDING MACHINE.

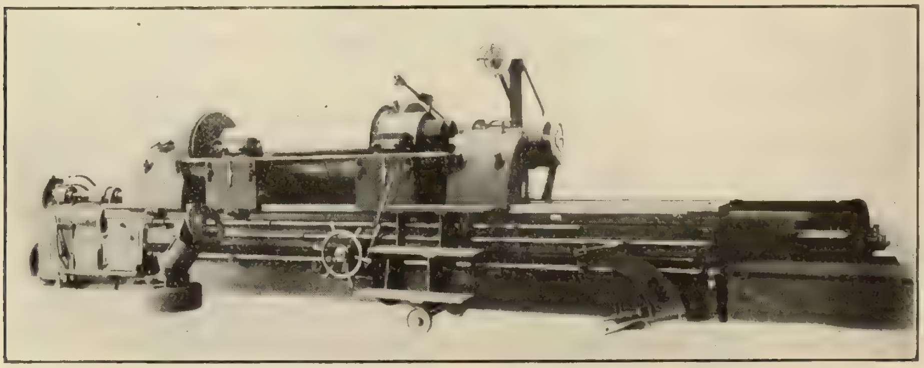
2.—Uniform and positive lubrication of the ways.

3.—A rigid and stationary foundation for the work, whatever its length or weight.

4.—No over-hanging of the work table, it being supported throughout its entire length by the main column of the machine to which it is firmly clamped, thus avoiding vibration, a feature which is very essential to rapid and accurate grinding.

A Manufacturing Product.

It is strictly a manufacturing machine, and while principally intended for grinding hardened steel and chilled rolls, is also especially adapted for finishing a great variety of other cylindrical work such as large shafts, pistons, corliss valves, plungers, torpedo tubes, laundry and printing press rolls, etc.



LANDIS ROLL GRINDING MACHINE.

The machine is self-contained in design, being entirely without overhead countershaft, although, when it is desired to drive from a line shaft, an auxiliary shaft with tight and loose pulleys, and a cone pulley for belting to the machine is required. This plan of construction makes it convenient to place the machine under a crane for lifting the work in and out, and offers no overhead obstruction to the passage of the crane.

For electric drive the motor is mounted on an extension of the main drive base, and can be connected direct to the drive shaft or belted as desired. The machine can also be driven with the motor placed on the ceiling or wall, in which case the base on the machine is not needed. The main drive is located in the rear of the machine, and consists of a shaft extending the full length, from which the different mechanisms are driven independently through belts. It is protected the entire length with a sheet metal guard.

The grinding wheel driving pulley traverses with the wheel carriage and is trunnioned in an independent carriage which travels on a track formed on the base of the main drive. The pulley is driven by rollers in its hub, which engage step grooves in the main drive shaft, and in travelling this makes a practically frictionless driving connection. The grinding wheel belt passes over idler pulleys, which are so arranged that the belt length does not change as the wheel head is moved on the cross slide. One of the idler pulleys automatically takes up any stretch in the belt, and at the same time keeps the latter under a uniform tension.

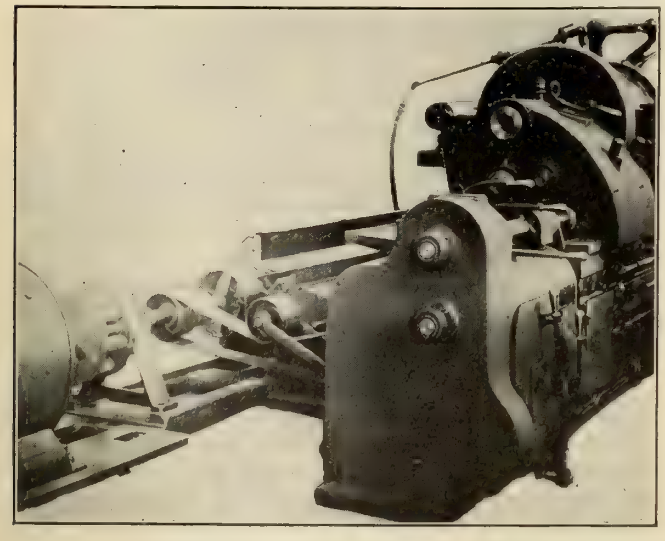
The work and traverse speeds are varied and operated independently of each other, an important factor in commercial grinding, as it gives the necessary traverse feed for any work speed. For grinding taper, the table swivels and has two scales, graduated in degrees and inches per foot.

The headstock is of heavy construction throughout and the work is driven by powerful gearing. The speed changes are made by an arrangement of levers at the front of machine. The footstock spindle is operated by a hand wheel which is geared to the screw, so that the centre can be easily run into the work with the heaviest piece in place that the machine will take.

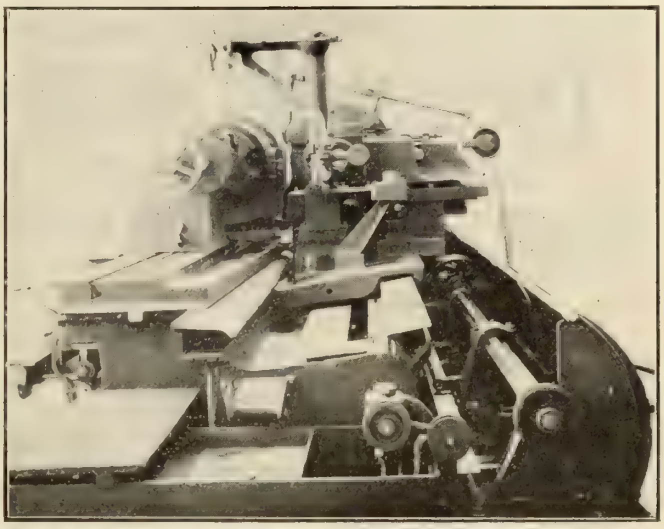
The grinding wheel head is massive and rigid, and is mounted on a vee and flat guide, of ample proportions to ensure a smooth and positive action when feeding for the lightest cut on the work. The spindle is made of special heat-treated steel and runs in bronze bearings which are adjusted in tapers for taking up wear. The bearings have a ball and socket connection with the base, which makes them easy to keep in line with the spindle.

The feeding of the grinding wheel to the work can be done either automatically or by hand. There is also a rapid power feed for moving the wheel back out of the way when changing the work, and also for bringing it forward to the grinding position. This is a valuable feature, as it saves considerable time as well as making the operating of the wheel easy and convenient. It is entirely independent from the hand and automatic feed, and is operated by a lever and simple arrangement of clutches. The automatic cross feed to the grinding wheel operates at each reversal of the wheel carriage, and can be set for cuts to reduce the diameter of the work from .00025 in. to .012 in.

The grinding wheel truing fixtures are three in number—one mounted permanently on the footstock, where it is in a convenient position for dressing the wheel when grinding necks of the rolls; another on one of the bearings, which carries the roll by the necks when grinding its face; and a third fixture for forming or rounding the corners of the wheel for grinding the fillets of the necks. This last is attached to the table of the machine.



LANDIS ROLL GRINDING MACHINE.



LANDIS ROLL GRINDING MACHINE.

The bearings for carrying rolls by their necks when grinding the body have three point bearings, which are adjustable for the variation in the size of the necks by wear and regrinding. They can be quickly removed and replaced with others for the different sizes of rolls. For grinding concave special bearings are required. These have vertical adjustments for tipping the roll to an angular position, with one end above and the other below the horizontal centre line of the wheel which results in a concave form being ground. The up and down settings are indicated by graduated scales, and are made by screw adjustments. These bearings can also be used for grinding straight rolls, and the arrangement of the bearing pads is the same as those described above. The concaving outfit includes a universal driver for the work.

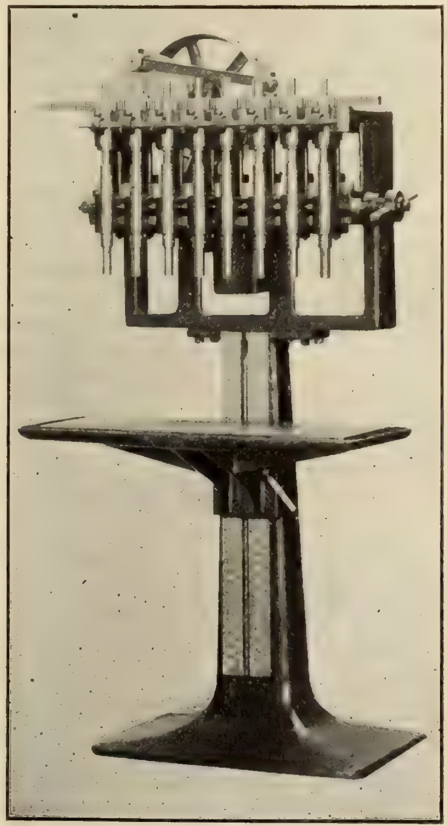
This machine is a recent product of the Landis Tool Company, Waynesboro, Pa., and is made in three sizes. The smallest size grinds work 30 x 120 inches, the intermediate 20 x 144 inches, and the largest size 30 x 168 inches.

G.T.R. SHOPS, MONTREAL.

NOTICES have been posted in the locomotive and car shops of the G.T.R. at Point St. Charles, Montreal, instructing the men that working hours will be reduced from fifty-five to fifty hours per week until further notice. This, it is expected, will mean a complete closing down of the works on Saturdays, as the men work ten hours a day. Recently the C.P.R. announced a similar reduction in time at the Angus shops.

ADJUSTABLE MULTIPLE SPINDLE OSCILLATING VALVE GRINDER.

THE Adjustable Multiple Spindle Oscillating Valve Grinder illustrated herewith was brought out by the Foote-Burt Co., Cleveland, Ohio, and designed by them for use in the manufacture of automobile engines, as a complete set of valves can be seated in less time than it ordinarily takes to seat one by the hand method.



ADJUSTABLE MULTIPLE SPINDLE OSCILLATING VALVE GRINDER.

The spindles reverse every one and a quarter turns, and a cam is provided which raises and lowers them every twenty revolutions to allow the grinding compound to enter the valve seat. Any number of spindles can be furnished, from two to twelve, depending on the type of cylinder, and they are adjustable up to a minimum centre distance of two inches.

The spindles are arranged with a ball bearing thrust on each end of the bearing and have a travel of two and a quarter inches. The spindle noses are equipped with No. 1 Morse taper. The table is adjustable up and down to take care of different heights of cylinders.

The machine, as will be noted, therefore, is flexible, and any type of cylinder can be handled to advantage.

LARGE CONTRACTS PENDING.

SOME very large contracts are about to be awarded by the Government. Tenders for the Toronto harbor works, to cost half a million dollars, and each requiring a deposit of $300,000, were sent in on August 23.

Proposals for the second contract on the Welland Canal, estimated at $4,000,000, will be received on August 27, and for the first section of the Severn River end of the Trent Canal August 25.

Owing to the magnitude of the works, and the large deposits required, only large firms will be in a position to tender on the original contracts.

WHY AN INDUSTRIAL COMMISSIONER PAYS.

A TORONTO weekly newspaper has drawn attention to and mourned over the fact that the James Langmuir Paint Company has decided to remove its plant from the Queen City to Oakville, Ont., and explains that the reason of the move is because Oakville ratepayers promised to give the firm an exemption for a number of years. That is quite correct, for the James Langmuir Paint Company has purchased several acres in Oakville, and the move will shortly take place.

Why, asks this paper, does James Langmuir, who is a very rich man, have to leave Toronto to go to Oakville to avoid paying taxes? It suggests that legislation be passed to prevent municipalities mortgaging the property of their ratepayers in order to induce industries to move.

The suggestion is a good one, and has been advocated by "Canadian Machinery," but the question why James Langmuir should move to Oakville, is foolish. It is a business proposition. Probably this paint company, like many others in Toronto, has expanded to bursting point, and not being able to expand any further, not being offered any inducements to stay in Toronto, finding its taxes an intolerable and unnecessary burden, has turned its eyes elsewhere. Oakville, like many other suburban towns, has beckoned it, promising exemption from taxation, and James Langmuir and his big paint concern have answered the call. Who can blame him?

The point we wish to draw attention to is that the call of Oakville was louder and sweeter than that of Toronto, and the Langmuir Paint Co. is only one of many concerns who have packed up and moved into the country. There have been so many exoduses from Toronto lately, one has been compelled to ask the question: Is there no Industrial Department there, no Commissioner of Industries, no Board of Trade? There IS a Board of Trade, but no Commissioner, or a more determined attempt would certainly have been made to keep these prosperous and wealthy industries within the city limits

The names of at least four large Toronto manufacturing concerns occur to us at this moment, who have moved into the country from Toronto within the last few weeks. First, there is the firm of Rice, Knight, Limited, makers of lighting fixtures, who ran away to Goderich, there to build a large new factory. A firm manufacturing a similar line is moving to Lindsay, Ont., and will have a new plant built by Christmas. Then there is the James Langmuir Paint Co., and fourthly, Watsons, Ltd., makers of wire screens, who have been granted a bonus of $20,000 by Bradford, Ont., and will remove their plant as soon as convenient.

The mention of these four names recalls many other instances. Think of the Canadian Boving Co., who are building at Lindsay, Ont., The Pease Furnace Co., who moved their plant to Brampton, Ont., of the Hough Lithographing Co., Ltd., and the J. W. Hewetson Co., Ltd., shoe manufacturers, who have already purchased land for new plants in Brampton; of the Massey-Harris Co., who are building in the same town, of the Positive Clutch and Pulley Co., who moved their plant out to Aurora, Ont. By letting the mind wander through Weston, Ont., and other suburbs, many other startling examples will readily occur.

The time has arrived when the great Metropolis of Ontario, to which all business was supposed to flow, should adopt the slogan "Wake Up Toronto." Are the ratepayers of that city aware of the manner in which this important phase of civic work is being neglected? They see it daily recorded in the newspapers, but it means nothing to them. So blind are they, if a proposal to engage a man to save the industries were brought up, it would be voted down as a waste of money. How different to the attitude of the people of Bradford who, after stealing the plant of Watson's, Ltd., two weeks ago, held a torch-light procession to celebrate the achievement

The plea will be made that Toronto, unlike its pigmy neighbors, is not able to grant exemptions, free sites, loans and such like. Perhaps this is true, but she has other inducements to offer that no other city in Ontario can approach, and by inaugurating a publicity department, ways and means might be found by which these industries, which make the wealth of the city, may be saved.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, August 25, 1913.—The encouraging crop reports have caused a renewal of confidence in commercial circles, and it is generally anticipated that the volume of business done this fall will be large. Just at present, however, the machinery trade and allied interests are still very quiet. During the past week, one or two small orders have materialized, but nothing of much importance has developed, and there seems to be no immediate prospect of anything "turning up."

The Canada Iron Corporation.

On Thursday last, a not unexpected step was taken in connection with the Canada Iron Corporation's affairs. Since the cutting of the iron bounties a couple of years ago the company has had a hard time to make both ends meet, and finally, after two years' operation under bad conditions, has decided to wipe out its permanent fixed charges and start over again on a new basis. In order to do this in a regular manner, the directors decided to permit the appointment of a receiver, and on Thursday last an application was made by R. C. McMichael, of Brown, Montgomery & McMichael, representing certain creditors. Mr. F. F. Whyte, of New York, was appointed receiver to look after the affairs of the company. This gentleman is now in charge of the company. It has been announced by the officials that this is the first step in a re-organization of the company. Under the scheme, the mortgage debentures of the company will be retired, and the capitalization reduced to stock. Just how this will be done has not been decided upon, but probably part stock and part cash will be given in exchange.

Canadian Foundry Pig Iron.

Both the furnaces at Midland are now closed down, and are likely to remain so for some little time. Quotations on Canadian foundry pig will therefore be necessarily omitted from "Canadian Machinery's" market reports until such time as the Canada Iron Corporation's re-organization is completed.

Metals.

The market in metals remains fairly steady , with a slight tendency to rise. The present would seem to be a good time to buy, as dealers anticipate a very decided advance upon present low prices about a omnth from now.

Toronto, Ont., August 26, 1913.—While business in steel at mill prices is at a standstill, manufacturers preferring to do without rather than buy. Warehouse business is exceptionally brisk. There is a big demand for black sheets, plates, boiler tubes for rush jobs and repair work.

Machine Tools.

That the demand for machine tools still exists is shown by the specification sent out by R. S. Kent, of Brooklyn, N.Y., on behalf of the Atlantic Sugar Refineries, Ltd., St. John, N.B. Quite a number of firms are erecting new plants around Toronto, and should be buying new equipment. Considering the state of the money market, the amount of building going on is surprising.

Metals.

Big dealers in metals are advising those with metals on their hands not to sell, but to hold it until prices are better. The market for a week has been dead, with neither buying nor selling. Dealers declare they are not able to give stuff away. Everybody is playing the waiting game again. By Monday the market had become firmer and harder, but it was impossible to say what the future has in store. Dealers believe that these conditions cannot continue long, as very few consumers have stocks. The market in old iron and steel, like the metal market, is depressed.

St. John, N.B., August 23, 1913.—There is soon to be revived one of St. John's oldest and best known industries.

Connors Bros., who for many years conducted an extensive business here in the manufacture of rope in what was known as the "rope walk," have returned to the city from the West, and have purchased a block of land for the erection of a factory about 100 feet long and two storeys high. Both were in the rope business in St. John many years ago, but sold out to a combine, the understanding being that they would not manufacture rope in this city for twenty years. That period has now elapsed, and they plan to resume the manufacture. One of them said this week that the raw material can be landed in St. John quite cheaply, and, for a distributing point, conditions are splendid.

Lumber Industry Strike.

At present the outlook of a settlement of the strike which has demoralized the lumber industry about St. John all this summer seems a little more hopeful than for some time, but there is still nothing definite. One of the seven or eight big lumber mills have been shut down for about two months, that of Randolph & Baker has resumed operations, paying the old rate of wages to the men who have returned to work, and it is thought possible that the fact of this mill going may induce others to try to make a start. The wood-working factories and other industrial establishments are feeling the strike keenly as the supply of stock is hampered somewhat, while all the lime kilns in the neighborhood have been closed down for lack of fuel.

Canada Cement Co. Plant.

There is reason to believe that the Canadian Cement Co. plans to establish a big plant within a radius of thirty miles of St. John as an Atlantic centre. A gentleman in close touch with the cement situation said this week that the company proposes to erect this plant as soon as there is a market of sufficient importance in the Maritime Provinces.

St. Stephen, N.B.

At a meeting of the town council of St. Stephen, N.B. recently, there were opened tenders for the erection of a new shoe factory. The lowest, $10,855 was accepted and authority was given the finance committee to make whatever financial arrangements were necessary for the immediate completion of the building. The new industry is looked upon with much encouragement, and citizens generally are subscribing stock.

Sussex, N.B.

The Henderson Co. started borings for natural gas this week at Sussex, N.B., and the prospects for a successful well are apparently excellent. Should success greet their efforts at this place, it is reasonable to expect that before long there would be a pipe line for the supply of St. John. The company, said W. B. Dickson, M.L.A., this week, has met with success in Albert and Westmorland Counties where the supply of gas seems steadily increasing.

Stewiacke, N.S.

A new peg and woodenware factory is to be erected at Stewiacke, N.S., and a crew of men have been put to work making the preliminary arrangements. The building will be a fairly large one and will employ quite a number of men. G. E. M. Lewis, of Truro, N.S., is interested in the venture which is in connection wit hthe large tracts of timber area which Mr. Lewis secured from the Dickie estate some time ago.

AMERICAN LOCOMOTIVE CO. QUIT THE AUTOMOBILE FIELD.

THE American Locomotive Co., one of the three largest makers of automobiles in the United States, announced on August 20, that it had decided to abandon the manufacture of automobiles.

This decision was reached by the Board of Directors at a meeting on August 13, but nothing was said about it until after the second and later meeting. The following statement was given out on behalf of President W. H. Marshall:

"The directors of this company, at a meeting held on August 13, decided to discontinue the manufacture and sale of automobiles and motor trucks.

"The company takes this opportunity to assure all owners of ALCO vehicles that arrangements will be made to furnish them with repair parts for a period not less than five years to come, further, that it will fulfill in every respect its obligations given under guarantee to its customers."

The American Locomotive Co. engaged in the manufacture of high-priced cars in 1906, when it obtained the American rights to the Berliet car. Skilled mechanics were brought from the Berliet plant in Lyons, France, and an immense factory was built in Providence. The new car proved an immediate success from the buyer's standpoint.

Has $6,000,000 Invested.

The ALCO has been the highest priced car made in America, most of the pleasure cars selling for $6,000. In the past three or four years the company has been pushing the manufacture and sale of heavy trucks as a more profitable end of the business. It ranks third among the American manufacturers of commercial vehicles. In the past year 85 per cent. of its business has been in trucks and 15 per cent. in pleasure cars. It makes more taxicabs than any other concern in the United States. The ALCO has enjoyed the distinction of being the only automobile to win tthe Vanderbilt Cup twice. It won the great classic in 1909, and repeated the performance in 1910.

So far as can be learned from men familiar with the company's affairs, the ALCO car is not to be made by any other company, and the enormous plant at Providence will be dismantled. It is said that the American Locomotive Co. has $6,000,000 invested in the manufacture of motor cars. There are 1,200 employees at Providence, where high salaries have been the rule. It is understood that all of the employees other than those needed for the maintenance of service stations and in the manufacture of parts have been given thirty days' notice.

Besides the Providence plant, the company occupies an entire building at Broadway and Sixty-second Street, with a lease having fourteen years more to run. At Long Island City it has a completely equipped service plant, with a building which cost $100,000, where parts worth $125,000 are carried in stock. At Chicago it has a branch costing $112,000, while a service station on the Pacific Coast is valued at $175,000. In Philadelphia a building is leased by the company at an annual rental of $25,000, and one in Boston at $15,000.

The factory at Providence has a real estate value of $1,000,000, and is said to be the most complete plant of its kind in America. It contains a large amount of costly special machinery, a large chemical laboratory, testing grounds, and service station.

Sold Its Cars at a Loss.

Automobile men say that the ALCO always has been sold at a loss, owing to the remote location of its plant, the cost of getting raw material to Providence, and delays in making deliveries. The latter factor is said to have played an important part in running up costs. It is asserted that one-third of the company's output in recent years has reached the market after the season has closed. One well-known authority in the trade said that the company operated at a loss of $600,000 last year.

In an attempt to lower unit costs by increasing the volume of sales, Harry S. Houpt was engaged as general sales manager two and a half years ago. At that time the company had only four agencies. With a liberal advertising appropriation, Mr. Houpt began an aggressive campaign, which resulted in an increase of 365 per cent. in the sales and the acquisition of eighty-nine agencies for placing the cars. Houpt left the ALCO Company last March to take the New York agency of the Lozier.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Ottawa, Ont.— Thomas McLoughlin, contractor, had much machinery used in excavation work destroyed by fire here on Aug. 19.

Vancouver, B.C. — Fire destroyed the plant of the Empire Engine Works, corner Sixth avenue and Alder street, Kitsilano, causing a loss of $10,000.

Sherbrooke, Que. — The Canadian Brake Shoe Co. will shortly commence operations in Sherbrooke. It will make steel and brass forgings by electricity.

Quebec, Que. — The plans for the workshops of the National Transcontinental Railway at St. Malo are on exhibition at the engineers' office here. Tenders are to be called for on Sept. 1.

Montreal, Que. — Allan G. McAvity, the representative of the Canadian Buffalo Forge Company, of Montreal, has announced that the company contemplated starting building at Berlin, Ont., in about two weeks.

Toronto, Ont.—Wm. and J. G. Greey have secured a permit to build an addition to their foundry at Esplanade and Church streets. It will be of concrete and brick construction, and will cost $15,000. Some equipment will be purchased.

The Doherty Mfg. Co., Sarnia, Ont., makers of stoves, have built new offices, warerooms, and shipping rooms of 3-storey construction, costing $25,000. This will give them more room for manufacturing. The mounting and fitting shop is being enlarged.

Windsor, Ont. — The Kelsey Wheel Company and Canadian Roofing Company, two of Windsor's promising manufactures which recently located in the city, have paid to the city treasurer $2,800 for property in the factory district. The Kelsey Company's cheque calls for $2,000, while the Canadian Roofing Company paid $800.

Medicine Hat., Alta. — The Western Threshing Machine Co. have deposited with the city council of Medicine Hat $1,000, as an evidence of their good faith in entering into a contract with that city for certain concessions which include free gas for five years and three acres of land, with an option on two more.

Sault Ste. Marie, Ont.—The new $60,000 coal unloader on the Ontario dock was destroyed in a cyclone on Aug. 22. It was owned by the Playfair interests, and had only been completed two hours. The unloader was of double tramway type, and was one of the most up-to-date on the great lakes. With its great capacity it would have unloaded an eight-thousand-ton vessel in one day.

MACHINE TOOL SPECIFICATION.

Specifications for the following equipment have been sent out by R. S. Kent, Mechanics' Bank Bldg., Brooklyn, N.Y., who is buying machine tools for the new St. John, N.B., plant of the Atlantic Sugar Refineries, Ltd., Montreal.

Machine Shop.

- 36 in. lathe.
- 20 in. lathe.
- 12 in. lathe.
- 48 in. planer.
- 24 in. shaper.
- 51 in. vertical boring mill.
- 1½ in. bolt cutter.
- 1 power hack saw.
- 24 in. drill press.
- 40 in. do.
- Wet tool grinder.
- Machinist vises.
- 5-ton hand traveling crane.
- 2 hydraulic jacks.
- 6 in. pipe threading machine.
- 12 in. ditto.
- 2 combination pipe vises.
- 6 in. to 12 in. pipe vise.

Blacksmith Shop.

- 2 forges.
- 2 anvils.
- 2½-ton steam hammer.

Coppersmith Department.

- 1 forge.
- 15-ton hydraulic bending machine.

Carpenter and Pattern Shop.

- 24 in. turning lathe.
- 26 in. band saw.
- 1 circular saw.
- 2 wood trimmers.
- 1 universal wood worker.
- 1 grindstone.

Montreal, Que.—Work on the Longueuil plant of the Sir W. G. Armstrong, Whitworth & Co., Ltd., is progressing. M. J. Butler announces that the concrete foundations are almost completed. The first building will be up by the middle of December, and the plant will be running by May 1, 1914. This part of the plant will be equipped for the manufacture of high speed steel, twist drills and other high speed tools. Other departments will gradually be added.

Vancouver, B.C.—Arrangements have been made by the American Can Company for the establishment of a local branch at Vancouver. A modern structure of reinforced concrete is to be erected at a cost of $100,000, and construction will be started at an early date. Excavation operations are now being carried on. The American Can Company is a corporation with its head office in New York. Contracts have been entered into with the Imperial Oil Company, and a number of the salmon and fruit packers for supplying tins.

Electrical

Montreal, Que.—The Halifax Electric Tramway Co. have issued new stock for extension and improvement of the system.

Toronto, Ont. — In connection with the steam reserve plant to be constructed by the local Hydro-electirc Commission Chief Engineer H. H. Cousens is investigating a proposal to utilize the exhaust steam for heating purposes.

Guelph, Ont. — North Wellington is taking up the hydro power question. Hon. Adam Beck will address a meeting in Elora and Fergus, both meetings being in the interests of hydro electric power installation in the two towns.

Brampton, Ont. — The Erindale Light & Power Co., has applied to the Toronto Township council for permission to raise $50,000 on property to complete dam and generate 500 more horsepower. At present, only 400 horsepower are generated.

Prince Albert, Sask.—The city council has decided to suspend operations to some extent on the La Colle Falls dam, owing to lack of funds. Excavations for the tail race and spillway will be continued. J. M. Voith, Heidenheim, Germany, was awarded the contract for power equipment for this scheme.

A Business Connection Your Best Insurance Policy

WANTED — HIGH-GRADE SALESMAN WITH thorough knowledge of machinery and engineering to cover Ontario. Must have strong connection with manufacturers on this ground. An attractive salary is offered, and replies will be treated confidentially. Box 786.

¶ Looks innocent, this little want ad., doesn't it?

¶ To the average reader a salesman is wanted—nothing more. The more thoughtful will reason it out that some big house is making a change, interest is aroused as to the cause, and speculation as to the identity of the firm.

¶ Few men, however, realize that this little ad., and hundreds of similar ones which appear every year in the daily papers, proves conclusively that connection maintained through salesmen alone is not the forged-steel and unbreakable thing it is fondly imagined by many men.

¶ The majority of want ads. for salesmen stipulate that applicants **must have a good connection.**

¶ This means that a salesman in changing jobs can take his connection with him to a new position. If he takes it with him he can't leave it behind.

¶ Personal salesmanship is personality at work. A customer's impression of a house or manufacturer is created almost entirely by the personal representative of that house. If the salesman be genial, enthusiastic and sympathetic, a good impression is formed, and a friendly feeling toward the house is established.

¶ A connection founded on "personality" and maintained entirely by the salesman on the road is no stronger than a salesmanager's ability to keep the salesmen in his employ.

¶ And not infrequently the salesmanager jumps the job and takes one or more star salesmen with him.

¶ There is only one absolutely safe and reliable connection, and that one is built on and by **advertising.**

¶ Salesmen may come with their connection and go with their connections, but advertising stays right on the job from the day it starts until the end of time.

¶ Every dollar spent on it belongs to the man who invests it. No competitor can steal it or coax it away.

¶ Advertising can be made very personal, and it can be made to build up a strong bond of sympathy and good feeling between customer and advertiser.

¶ We do not for a moment deprecate the value of the personal salesman—more power to him. He is very necessary, and the stronger a man's personality the more necessary he becomes. And the bigger he is the more he realizes the value and the assistance advertising gives him in his work.

¶ We do not belittle the salesman, because he is great and powerful, but we do claim that his connection, though mighty, is transferable like his affections—else why the stipulation in the want ad?

¶ Why not start in at once to build for yourself and your house a connection that can never be lured away? It costs so little, and it accomplishes so much!

Rate Card and full information gladly furnished

Canadian Machinery & Manufacturing News

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.

143 University Avenue, TORONTO

Toronto, Ont. —Cluster lights of 500 candle-power are to be placed over the centres of the roadways at the important corners in the city, the experiments of the Hydro-Electric Commission with them having proved a success. There will also be 300 candle-power clusters hung over the less important intersections.

Port Hope, Ont.—The Seymour Power Co., Toronto, will instal additional equipment costing $10,000. The ratepayers have granted them a ten-years' franchise to supply power.

New Toronto, Ont.—The Ontario Hydro-Electric Commission has informed the council that the material for the proposed power and light system has been ordered.

General Industrial

Holland, Man.—The Farmers' elevator here, has been destroyed by fire. The loss is estimated at $10,000.

Brampton, Ont.—The Terra Cotta Brick Co.'s engine house was destroyed by fire Aug. 20.

Toronto, Ont.—Robert Crean & Co., Ltd., hat manufacturers, will re-build their plant on Balmuto street.

Fort William, Ont. — The F. A. Guy Grain Co., is erecting a grain drying plant in connection with its elevator.

Montreal, Que. — The plant of the Rideau Shirt Mfg. Co., in Maisonneuve, Que., was burned down on Aug. 22.

Greenwood, B.C.—A local company will build a canning factory in Grand Forks at a cost of $13,000.

Greenwood, B.C.—The Steelite Explosive Co. has bought a site on Mill Creek, across the lake from New Denver, and will build a factory.

Revelstoke, B.C.—The West Kootenay Steam Laundry, owned by Earl Barraclough, was destroyed by fire Aug. 16. Loss $20,000.

Kingston, Ont. — The model cheese factory at Inverary, was destroyed by fire Aug. 22. It was valued at $8,000, and insured for $2,000.

Toronto, Ont. — A new laboratory for electro-plating will be equipped at the new Central Technical School by the Electro-Platers' Association.

Halifax, N.S.—As a result of the inauguration of direct sailings between Halifax and Italy, this city may become the site of a silk manufactory if negotiations now under way materialize.

Toronto, Ont. — Wilkinson & Gregg have obtained a permit for the erection of a brick warehouse for Ald. Rawlinson at St. Nicholas and St. Joseph Sts. It will cost $26,000.

Winnipeg, Man. — After inspecting conditions here, Col. F. S. Meighen and W. H. Hutchinson, president and vice-president, respectively of the Lake of the Woods Milling Company, have decided to erect another mill in the West.

Oshawa, Ont.—Col. J. F. Grierson and Mr. T. B. Mitchell were in Toronto recently interviewing the officers of the Eastern Rubber Company, relative to locating in Oshawa. It has been known for some time that this industry has had its eye on this town as a most suitable place to establish its business.

Toronto, Ont.—An order winding up the Dominion Refineries of North Bay was made at Osgoode Hall last week, and no opposition was offered to the application. The company was incorporated in 1911 with a nominal capital stock of $50,000. 21,347 shares have been allotted, and $11,791.42 will be paid up.

Lethbridge, Alta.—The Ogilvie Co. will shortly erect a series of elevators in Southern Alberta to act as feeders to the new Medicine Hat mill just completed. Coaldale or Cin will be selected as one of the sites, while the other two have not been decided upon as yet. Mr. Black is at present in the West making arrangements for these improveme

Vancouver, B.C. — A powder plant will be established on James Island, B. C., by the Canadian Explosives, Ltd., a company recently reorganized to include the Hamilton Powder Company and the Victoria Chemical Co., Ltd., and the controlling interests held by the Nobel's Explosives, Ltd., of Glasgow, Scotland. A plant to cost about $1,250,000, will be built on an 800-acre islet a short distance from Victoria, B.C. Most of the machinery will come from England and the United States, although some will be the output of Canadian factories. The output of the new factories will be 100 tons of high explosives and black powder daily.

Wood-Working

Morden, Man.—The chopping mill of A. H. Snellgrove, with machinery, was destroyed by fire Aug. 19.

Omemee, Ont.—Courtney's saw and shingle mill was completely destroyed by fire August 12. There is no insurance.

Goderich, Ont.—On August 22 the Kensington Furniture Company was completely destroyed by fire. The loss is about $40,000, mostly covered by insurance.

London, Ont. — Industrial Commissioner Philip will endeavor to secure the establishment here of the Kensington Furniture Co., whose big plant at Goderich was wiped out by fire last week. The chief shareholder is F. G. Rumball of this city, who is interested in other woodworking factories in London, and it is believed that he might be induced to bring the furniture industry to London.

Quebec, Que.—Mr. E. T. Nesbitt, who recently acquired the old Brown rope walk property at Limoilou, and intends to erect a large lumber manufacturing factory on it, was granted an exemption of taxes for a period of ten years at the meeting of the City Council recently. He intends to erect one of the most modern plants of wood manufactory, and in the connection will have erected a planing mill 200 feet long by 100 wide.

Water Works

Melville, Sask.—The town council is planning the installation of sewage disposal works. The secretary is F. H. Clarkson.

Swift Current, Sask.—Bylaws to provide $80,000 for waterworks system and $28,500 for erection and equipment of fire hall have been passed.

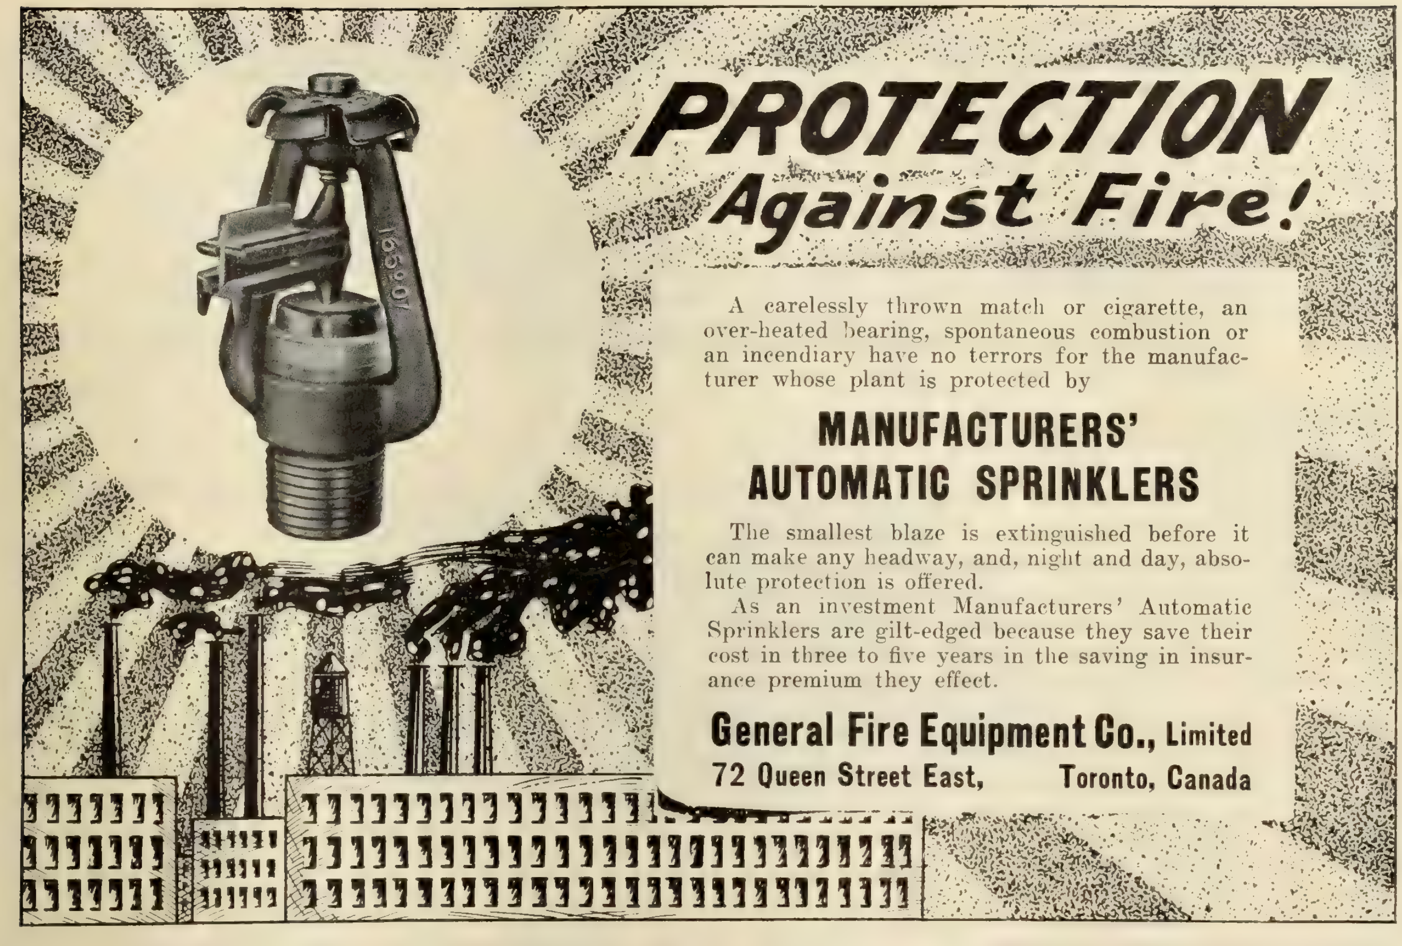
Leaside, Ont.—At a meeting of the council last week, it was decided to raise $60,000 for a water-works system, and $60,000 for sewers. Mayor McCrea.

Calgary, Alta. — A. W. E. Fawkes, waterworks engineer, has planned a 44-mile pipe line to the Rocky Mountains. The whole scheme will cost over $1,000,000.

Toronto, Ont.—That a site for a new reservoir in North Toronto is actually under consideration by the city is evinced by the activity on the old Gartshore property west of Yonge street and just north of Eglinton avenue.

Toronto, Ont.—A recent water famine on the Island has proved the 6-inch mains there to be inadequate. It was designed to supply 500,000 gallons. Mayor Hocken is urging the installation of a better system, with bigger pumps.

Stamford, Ont.—The municipality of the town of Stamford will instal a water plant, with stand pipe, pressure tanks, pumps and other accessories.



PROTECTION Against Fire!

A carelessly thrown match or cigarette, an over-heated bearing, spontaneous combustion or an incendiary have no terrors for the manufacturer whose plant is protected by

MANUFACTURERS' AUTOMATIC SPRINKLERS

The smallest blaze is extinguished before it can make any headway, and, night and day, absolute protection is offered.

As an investment Manufacturers' Automatic Sprinklers are gilt-edged because they save their cost in three to five years in the saving in insurance premium they effect.

THE DOMINION STEEL CASTINGS COMPANY, Limited
HAMILTON, - - - ONTARIO

Arthur G. Bridge, Stamford, is conducting negotiations.

..**Quebec, Que.**—A petition, signed by the Mayor of Sherbrooke, other towns, and also many leading merchants of the Eastern Townships, has been forward to Hon. Jules Allard, Minister of Lands and Forests of the Province of Quebec, requesting that storage reservoirs be constructed and operated at the head of the St. Francis River.

Railways—Bridges

Welland, Ont.—It is proposed to erect a new bridge across the canal here.

Ottawa, Ont.—The new C.N.R. line, Ottawa, Smith's Falls and Toronto, is nearing completion, but it will be the beginning of the year before it will be open for regular traffic all the way.

Toronto, Ont.—Work on the Toronto Eastern Electric Railway, is practically at a standstill, though the grading is all finished between Pickering Village and Bowmanville. West from Pickering Village to the city the exact line has not yet been definitely settled, and it is likely that the northerly route may be abandoned in favor of the Cherrywood district.

Montreal, Que. — Semi-official announcement has been made that the Harbor Commissioners will commence the construction of a steel bridge across the St. Lawrence River early next spring. Draft copies of the plans of the new bridge have, it is said, been sent to the municipal authorities of St. Lambert, the municipality immediately opposite McGill Street, Montreal.

Welland Ont.—The G.T.R. line from Niagara Falls and from St. Catharines through Welland is being gone over by representatives of the Pennsylvania Railway. The explanation generally accepted is that the Pennsylvania has designs on the Wabash system which runs over the G.T.R., and it is said that negotiations are now in progress to buy out the Gould system.

Hamilton, Ont.—Actual work on the Port Dover, Dunnville, Wellandport and Beamsville Electric Railway, which has been hanging fire for several years, will be started this week. The new line will connect with the Hamilton, Grimsby & Beamsville Railroad at Beamsville, and from Beamsville to St. Catharines a connecting road will be built to connect with the Niagara, St. Catharines and Toronto Railway for Niagara Falls.

Tenders

Welland, Ont.—Tenders for the erection of the plant for the Union Carbide Co., at Welland, Ont., are now being called for, and the contract will likely be let within a week or two.

St. Catharines, Ont.—Tenders will be received by the Armstrong Cork Co., Pittsburg, Pa., for the erection of a one-storey plant, costing $40,000, concrete foundation, frame and galvanized iron construction.

Toronto, Ont. — Tenders have been called for three 180 h.p. water tube boilers. Four direct-connected d.c. generators, elevators, stokers and feed-water heaters, for the new Dominion Bank, at the corner of King and Yonge streets. The Canadian Stewart Co. are general contractors. The contracts will be awarded this week.

Toronto, Ont.—The principals of the T. A. Gillespie Company, of New York, Messrs. Laurin and Leitch of Montreal, and of Messrs. Booth and Flynn, of Pittsburg, three large contracting firms, were here last week to consider the joint bid which they propose making for the harbor improvement contract. The bid will be made under the name of the Montreal firm, and will be for the breakwater and seawall. Engineers of the concerns have been in the city for some weeks gathering information.

Ottawa, Ont.—Tenders, addressed to the undersigned, and marked on the envelope "Tender for Shops," will be received by the Commissioners of the Transcontinental Railway at Ottawa, Ontario, until 12 o'clock noon of Tuesday, 2nd September, 1913, for the construction and erection complete, in accordance with the plans and specifications of the Commissioners, of a locomotive and car shop repair plant at St. Malo, P.Q. The plans, details and specifications, which will include the locomotive and car shops, the yard sewerage system and drainage system, yard water system, and the yard grading and track-laying, may be seen at the office of Mr. Gordon Grant, chief engineer, Ottawa, Ontario, and at the office of Mr. A. E. Doucet, district engineer, Quebec, P.Q.

Contracts Awarded

Toronto, Ont.—The contract for the equipment of the new civic abattoir has been awarded to Mr. Perrin, the architect in charge of the building, for $108,376.

Edmonton, Alta.—H. F. Brackenbridge has been awarded by the Wabamun Power & Coal Co., the contract for cutting a 1,000-foot tunnel at its mine, which is half a mile north of the G.T.P.

Toronto, Ont. — Messrs. Donnelly, Graham and Gerow, of Cleveland, O., have been awarded the contract for sewers costing about $700,000. Compressed air will be used.

Cobalt, Ont. — The contract for the building of the new town hall was awarded at a special meeting of the council to Hill, Clark & Francis of New Liskeard. Their price was $37,700.

New Incorporations

L. E. Moulton & Co., Ltd., incorporated at Ottawa, capital $50,000, to do business as pipe makers and contractors, at Montreal; incorporators: Lyman E. Moulton, Joseph A. Cousineau, etc., Montreal.

Ecothermal Stove Co., of Canada, Ltd., incorporated at Ottawa, capital $100,000, to manufacture and sell stoves, ranges, etc., at Kingsville, Ont.; incorporators:—Bon Jasperson, George Jasperson, etc., Kingsville, Ont.

Trade Gossip

J. L. Weller, of St. Catharines, Ont., chief engineer in charge of the Welland Canal, has given his name to a townsite at the entrance to the new Welland ship canal. It will be called Port Weller.

The McKinnon Sash Company, Mnfrs. of carriage and saddlery hardware, St. Catharines, Ont., whose brass foundry was destroyed by fire some months ago, have rebuilt this plant, using the same equipment.

The Canadian Fairbanks Morse Co., Ltd., expect to occupy their new Vancouver warehouse about the middle of September. The Montreal building on St. Antoine Street, a reinforced concrete structure now going up, has reached the fifth floor.

J. H. Flaherty, representing the interests of Sir William Mackenzie, has gone to St. John's, Newfoundland, to take charge of a party which will spend two years in exploring the regions north of Hudson's Bay in search of valuable mineral deposits.

John M. Moore, late waterworks engineer, of London, Ont., has been officially appointed the appraiser of the waterworks plant for the investigation now being conducted at London into the operation of the system by a special joint committee of water commissioners and aldermen.

Frank Pullen, president of the Kilmer, Pullen & Burnham Co., electrical engineers, Toronto, Ont., is taking a trip to Europe in order to find out the latest wrinkles in connection with the work of the Swedish General Electric Co., and to secure details in connection with large orders which the firm has recently secured.

St. John, N.B. — In the Supreme Court, Chancery Division last week, in the case of Norton Griffiths Company v. the Norton Griffiths Dredging Company, Ltd., the interim injunction restraining the defendants from removing their dredging plant from St. John harbor was by consent continued till September 3. It is announced that the parties are trying to effect settlement and have agreed upon all terms except one.

Pig Iron in Canada.—In the first half of this year nine Canadian furnaces ran 181 days, two ran 180 days, and four from 42 to 74 days. The average number of days for the fifteen active furnaces was 167.6. The imports of pig iron into Canada in 1912 were 261,152 gross tons, as compared with 201,529 tons in 1911, 234,606 in 1910 and 148,247 tons in 1909. The exports were 6,229 tons in 1912, 5,241 tons in 1911, 8,717 tons in 1910 and 4,521 in 1909.

Personal

Thomas McMillan, vice-president of the Canadian Fairbanks Morse Co., Ltd., visited the company's Toronto branch this week.

Jack Thurston, formerly with the Olympic Foundry Co., Seattle, is now with the Mainland Iron Works at Vancouver, B.C.

William McKay, who for many years was manager for the Robb Engineering Co. at their Toronto office, is now with the Goldie & McCulloch Co., of Galt, at their Toronto office.

E. J. Chamberlin, president of the Grand Trunk System, is in receipt of a communication from Sir Herbert C. Perrett, Bart., Secretary-General of the Order of the Hospital of St. John of Jerusalem, informing him of his admission as Honorary Knight of Grace.

Albert V. Smith was the recipient of a watch and address from his fellow-workers of the packing room staff of the Canada Screw Co., Hamilton, Aug. 21, on his departure for the West. Pringle Morley, foreman, made the presentation.

G. J. Stock, of the "Stock" Oil-fired Converter Co., Ltd., Buffalo, N.Y., has returned from a business trip to the head office of his company at Darlington, England. He has arranged to carry one or two foundry lines in addition to his well-known converter.

Oakley T. Brown has accepted the position of mechanical engineer with the Mechanical Engineering Co., Ltd., Montreal. Mr. Brown was formerly connected with R. D. Wood & Co., Philadelphia, and the Camden Iron Works, Camden, N.J., where he acted in the capacity of expert gas engineer. He has also had a wide experience in the electrical field, and has had charge of a number of power plants in the United States. The Mechanical Engineering Co. are placing on the market a new system of gas fuel furnace, which is meeting with good success.

Catalogues

Orenstein-Arthur Koppel Co., Pittsburg, have sent us catalogue No. 412 describing their cast plate track and charging cars for power plant boiler rooms, hotels, office buildings, etc. The Canadian sales agents for this company are the Canadian Fairbanks-Morse Co., Ltd.

The Canadian Consolidated Rubber Co., Ltd., Montreal, have forwarded a copy of their catalogue "A," which deals with the company's lines of belting for power transmission and conveyor purposes; steam, air and fire hose; sheet packing; ring packing, etc., etc. The catalogue is well gotten up, and contains numerous useful tables and rules for belt lacing.

The Garvin Machine Co., New York, have sent us a copy of circular No. 195 devoted to the "Garvin Wrenchless Chucks." The chucks are made in various sizes and types, and are fully described and illustrated. The stop and open mechanism as applied to monitor lathes and screw machines is explained clearly. Copies will be gladly sent to interested readers on request.

Book Reviews

The Scientific Price Maker and Profit Determiner, compiled and published by J. W. Couchar, New York City, in two volumes, price $1 and $2, respectively. This book consists of a series of price tables, giving the cost of an article and percentages to be added in order to arrive at the selling price. The purpose of the book is to provide a rapid method for arriving at a profitable selling price on the basis that the true cost is not the price paid for an article, but the price paid, plus freight and sale's expenses. Volume 1 contains thirteen tables giving selling prices computed on cost of doing business at from 12 per cent. to 24 per cent. on sales; and volume 2 contains twenty-eight tables, with prices computed on cost of doing business at from 7 per cent. to 34 per cent. of selling price. The method of reading the tables is fully explained, the figures being clear and easily read.

149,793—Dr. Heinrich Speeketer, Griesheim, Germany. Production of zinc and other metals of a similar nature.

149,797—Albert Theobald, Paris, France. Temperature regulating apparatus.

* * *

DECREASE IN BUILDING.

TIGHT money, which has been largely responsible for the restraint in financial growth during the current year, is being manifested in the decided falling off in building in many parts of the Dominion, and in the number of offices vacant in many of the newer buildings. For the month of July the aggregate decrease was 26 per cent.

The Maritime Provinces and Ontario taken altogether showed a substantial increase, Toronto's expansion being remarkable. The West, however, was less satisfactory. In British Columbia the decrease was something like 75 per cent. and each of the other Western Provinces showed declines. The same may be said of the West, only on a smaller scale, during the past seven months, while the East has, generally speaking, shown a more moderate increase than during the previous month.

* * *

Mr. Geo. Janin, City Engineer of Montreal, is taking a six weeks' vacation trip to Europe. This is the first vacation Mr. Janin has had for several years.

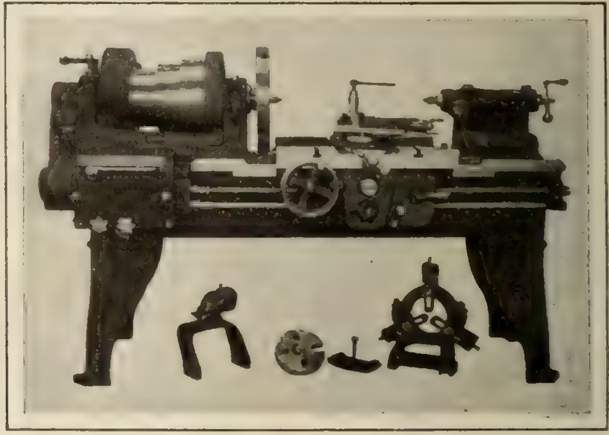
Everett, Mass., U.S.A.



The Mueller Heavy Duty Lathe is built to meet the severest requirements of the modern shop. It is a highly accurate tool and easy to operate. All gears on it are made of steel and cut from the solid with special cutters. Phosphor bronze bushings throughout.

We can recommend the MUELLER Heavy Duty Lathe to anyone in need of a high class lathe, for either tool-room or manufacturing purposes.

Ask us to tell you about the many good features of this machine and the cost of it under your line shaft.

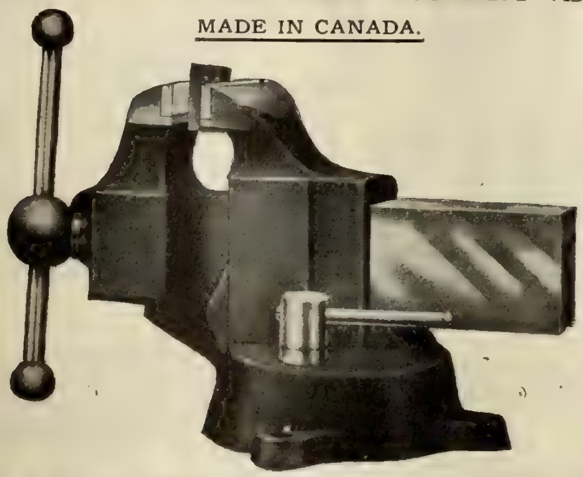
The YOST

Solid Jaw and Swivel Bottom Machinist's Vise

MADE IN CANADA.



A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satisfaction. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

Incomparably Good

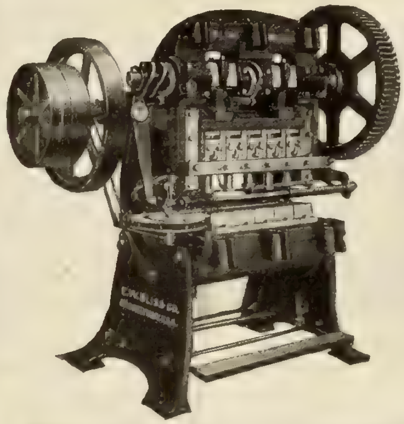
The National catalog would certainly interest you. Write us, asking for a copy.

National Machinery & Supply Co., Ltd.

HAMILTON - - ONTARIO

This Guarantee Goes With Every Vise: We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

Five Operations Every Stroke



Five times as fast, it means multiplied production, reduced costs, and saving in shop room.

Bliss Automatic Combination Presses perform five operations every stroke, eliminating intermediate handling and all danger to the operator's hands.

They produce with great economy articles requiring a series of operations, and are adapted for making lamp sockets and burners, and many electrical stampings.

Electrical Catalog 12G, on request.

Thor **CLOSE-QUARTER PISTON AIR DRILLS**

Are the original Nos. 8 and 9 motors for close-corner work. The neat and compact construction of these drills, together with the design of the mechanical parts, have resulted in their becoming the most successful pneumatic tools ever placed on the market. They are often imitated, but never equaled. Every mechanic appreciates the value of a Thor close-corner drill for steady service and economy. Sent on trial. Write for prices and catalog No. 9.

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

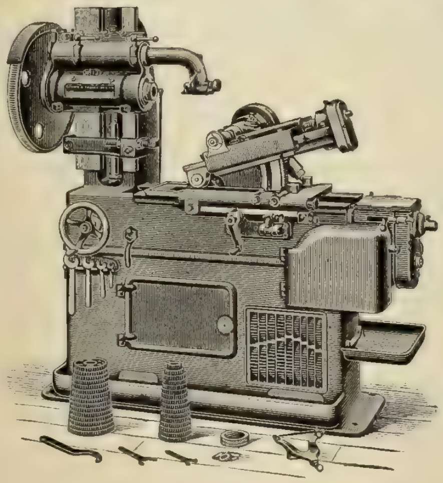
Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

Fast Operating Automatic Machine For Cutting Either Spur or Bevel Gears

No. 13 Automatic Gear Cutting Machine



Well adapted to cutting bevel gears in shops where fast production is essential. Also a valuable tool in any shop having a variety of spur and bevel gear cutting.

The machine not only operates fast in cutting, but indexes rapidly and is conveniently designed so that the operator can quickly change work or make any necessary adjustments. These features combined give the high efficiency required in modern manufacturing.

Capacity: Spur and bevel gears to 18 in. diameter, 4 in. face. Cast iron, 4 diametral pitch; steel, 5 diametral pitch.

Want a special circular describing the machine?

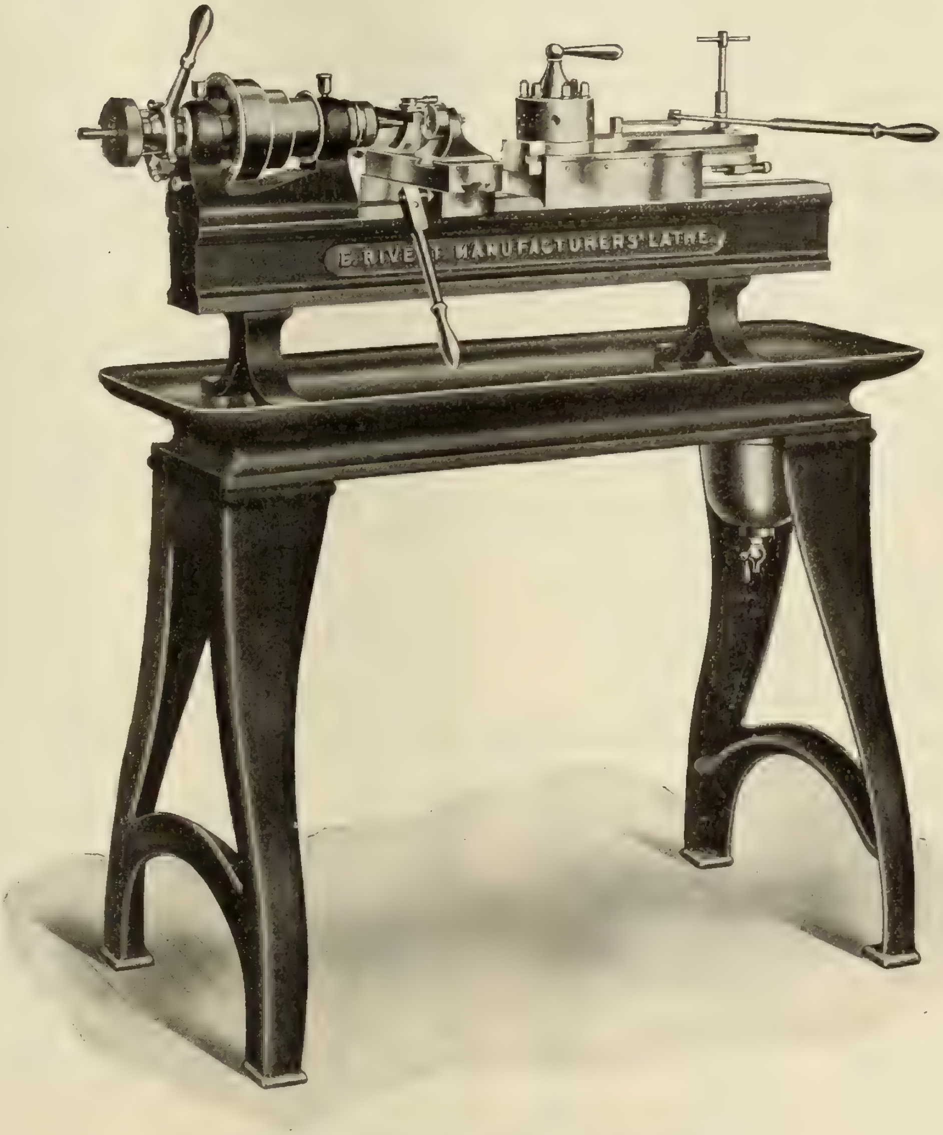
THE RIVETT HAND SCREW MACHINE



THE No. 5 LATHE

38" bed, 18" between centers, 7/8" through spindle, 8" swing, with Automatic Chuck Closer, Cutting-off and Forming Slide, Turret Attachment, Stand and Oil Pan.

The equipment shown here makes as strong and serviceable a screw machine as can be desired. The Lathe is built for heavy work, every part of it being designed to give the necessary strength and rigidity required with the large spindle capacity of the machine. The attachments are simple in construction, handy in operation, and will stand the strain of hard usage.

Information Wanted!

¶ There may be some eminently successful and well known firms who have never advertised.

¶ But who are they?

¶ Any information leading to the identification of such a concern will be gratefully, if unexpectedly, received.

¶ Our object in seeking such information is a worthy one, because no matter how prosperous and popular a non-advertising firm may be, we can offer a plan that will make them still more successful and favorably known.

¶ We can think of several concerns who do not advertise, but they are not noticeably prosperous, nor are their names in the machinery hall of fame.

¶ Neither are their names in Canadian Machinery's Buyers' Directory, which is a very respectable hall of fame in itself.

¶ Take your time and think it over.

¶ It will take time and it is worth the thought.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

An Inside Story Of The Crucible

In the walls of a Dixon Crucible is spun the secret of its efficiency, durability, economy, dependability and its world wide reputation.

If walls had voices, as they are said to have ears, a story of surpassing interest could be told.

—of a concern, the largest, oldest and only one of its kind in the world founded by the inventor of the graphite crucible.

—of a concern with world-wide knowledge of graphite deposits, with use for all forms and grades of graphite and therefore with no incentive to use other than the correct form and grade of graphite in each of its many products.

—of skill in workmanship which only the heritage of 86 years of experiences and discoveries can make possible.

—of a standard which does not permit of anything but absolute uniformity of the highest possible order.

In satisfaction alone it is worth while buying Dixon Crucibles, and in the economy of service Dixon Crucibles are supreme.

Write for booklet No. 223A. "The Care and Use of Crucibles."

SMOOTH-ON

TRADE MARK REG. U. S. PAT. OFF.

SMOOTH-ON
IRON CEMENTS
No. 1, No. 2 and No. 3

Permanently stop all leaks of steam, water, fire or oil, in iron or steel castings, boilers, tanks, piping, pumps, screw thread joints, flanged joints, etc.

Smooth-On No. 4 is unequalled for filling in blowholes in iron or steel castings.

The Smooth-On Cements are easy to apply and make permanent repairs, proved by years in use.

Every engineer should read our new No. 12 illustrated instruction book—FREE. It tells when, where and how to use the different Smooth-On Cements. Send for it now.

SMOOTH-ON MFG. CO.

THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

FREDERIC B. STEVENS
MANUFACTURER

DETROIT, MICHIGAN. **Export Warehouse: Windsor, Ont.**

a sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN

Shelton Metallic Filler

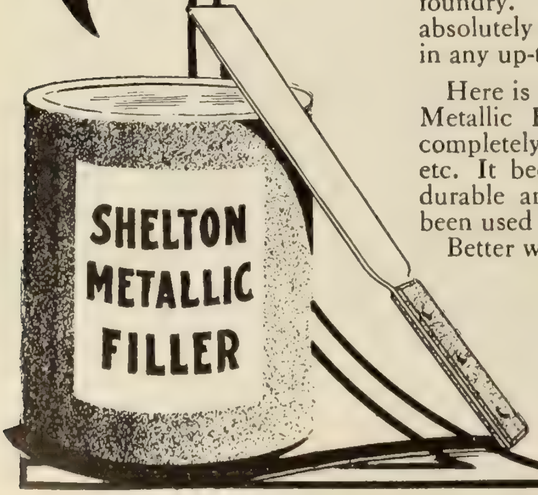
is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

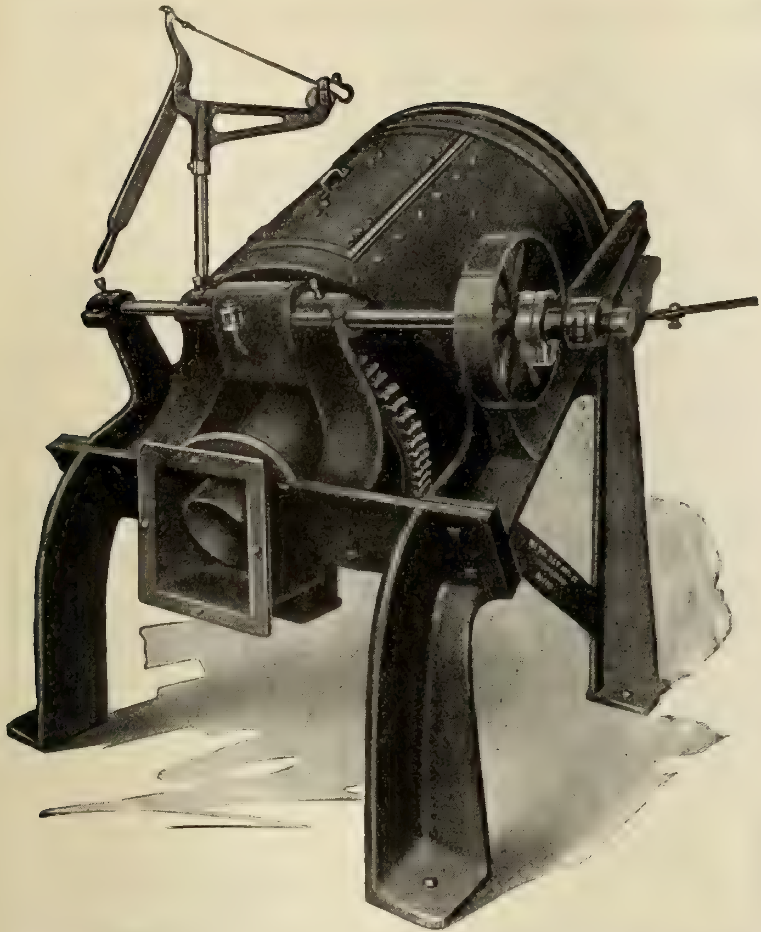
Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years. Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER

At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*



SHELTON METALLIC FILLER CO.
DERBY, CONN.



Another Feature of the

SLY SAND BLAST MILLS

Is the Heavy Steel Barrel

1 in. thick, to insure the greatest possible wear.

Mill is so constructed the machine is perfectly balanced and requires not more than one or two Horse-power to operate. All adjustments can be made without stopping machine, and is dust proof throughout.

Loading and unloading of this machine is a special feature found in no other Sand Blast Mill.

The Sly No Wear nozzle is of such design as to keep constant the same consumption of air at all times.

Cleaning Mills—Cinder Mills — Rosin Mills—Dust Arrestors.

Write for particulars.

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed. Write us.

CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

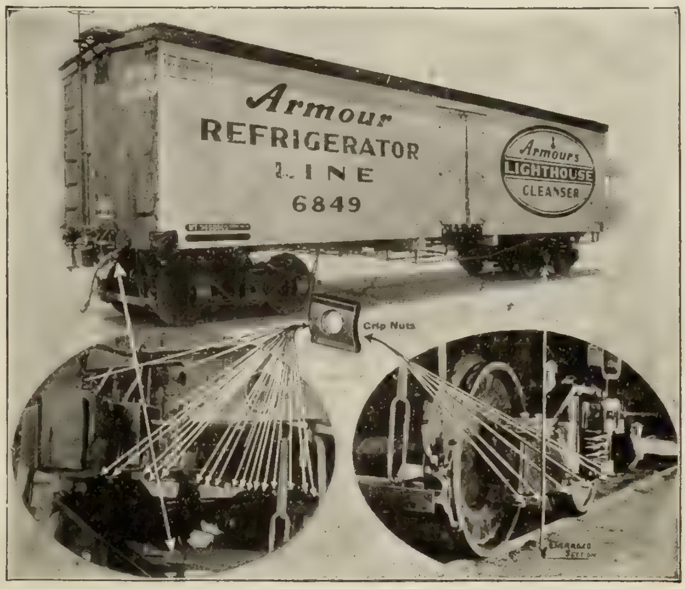
MONTREAL, Eastern Townships Bank Bldg. TORONTO, 143-149 University Ave WINNIPEG, 34 Royal Bank Bldg. LONDON, ENG., 88 Fleet St., E.C.

Vol. X Publication Office: Toronto, September 4, 1913 No. 10

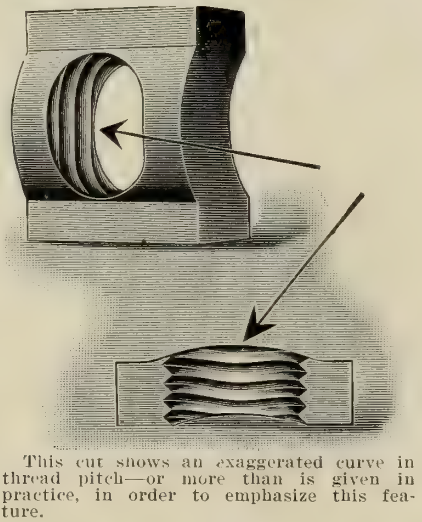
THE

GRIP

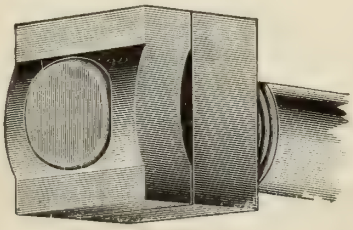
NUT



This cut shows car of which the enlarged sections are reproduced, showing **Grip Nuts** on the draft rigging, box and column bolts, etc. The greatest economy from the Grip Nut application is found on these cars where practically every bolt and nut is protected by a Grip Nut.



This cut shows an exaggerated curve in thread pitch—or more than is given in practice, in order to emphasize this feature.



This cut shows how the Grip Nut should be applied. No patented devices are required to take off or put on a Grip Nut. The ordinary wrench is all that is required.

For further particulars write

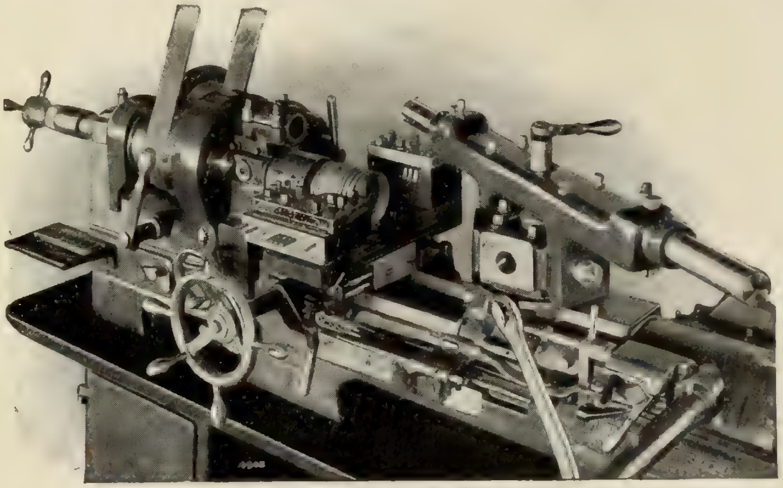
Head Office:—803 Eastern Townships Bank Bldg., Montreal, Que.
Works:—St. John, Que.

Most Rapid and Accurate Method of Machining Gas Engine Pistons and Rings



P. & W. Turret Lathe with Tool Equipment for finishing Gas Engine Pistons.

Simultaneously turns, faces and grooves pistons.

Produces a piston with uniform thickness of walls.

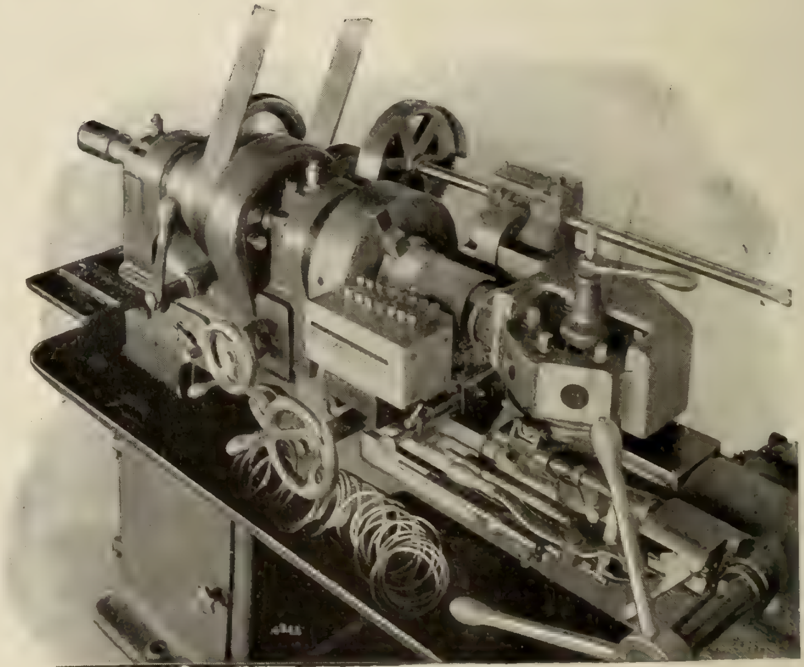
Turns out a piston of greater accuracy and at a greater saving than any other machine on the market.

Piston rings bored inside, eccentrically turned outside and cut off simultaneously.

P. & W. Standard Turret Lathes

Automatic features enable one man to operate several machines. These are not special machines, but standard P.&W. Turret Lathes. The tool equipment can be readily removed in a few minutes, leaving the machine ready for any standard turret lathe work.

The ease with which these equipments may be removed and interchanged, makes possible the furnishing of both piston and ring equipments for the same machine if so desired.



P. & W. Turret Lathe with Tool Equipment for finishing Eccentric Piston Rings.

Inquiries covering your individual requirement are solicited.

Write for catalog and illustrated circulars.

16 in. Lever POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

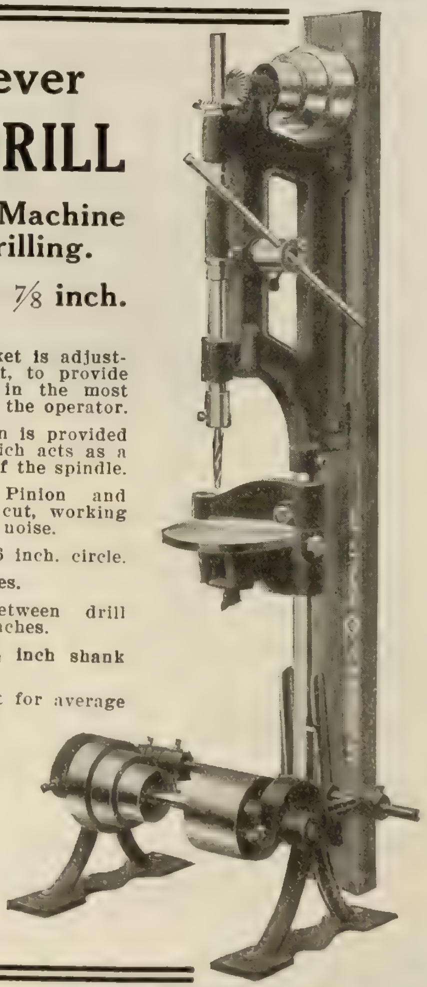
Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

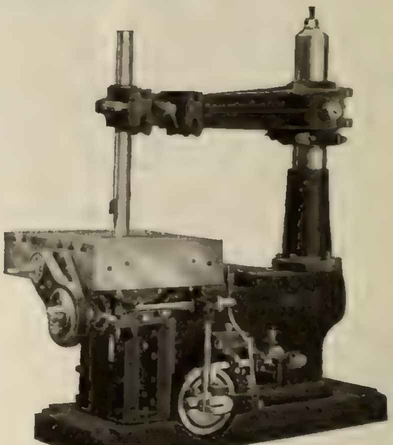
Speed of countershaft for average work, 300 per minute.

A. B. Jardine & Co.

Hespeler, Ontario



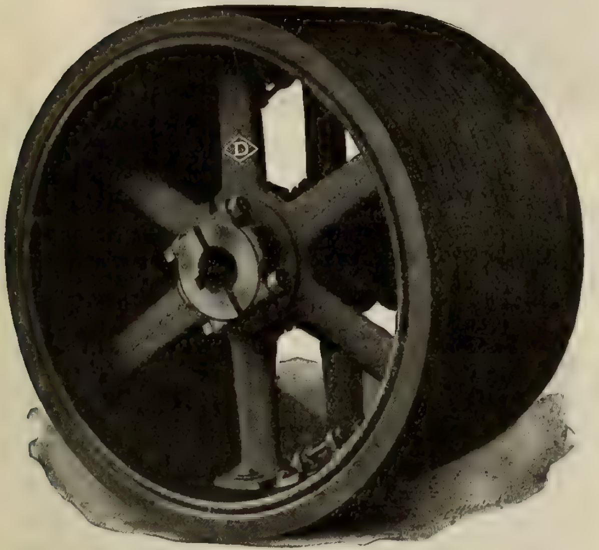
Keyseater and Slotter



Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

Baker Brothers, Toledo, Ohio.

The Pulley Without a Peer



DODGE

IRON CENTRE WOOD RIM PULLEY

¶ The combination of wood and iron is an engineering triumph. The wood rim gives high tractile efficiency, tests showing that it is superior to iron in the proportion of 46 to 22. Lighter belts and less tension can be used thereby minimizing pressure on bearings, all of which decreases friction.

¶ It can be run at a higher speed than any other pulley, — one of these pulleys was tested to a rim speed of five and a half miles per minute without any resultant damage.

¶ Made solid and split in all sizes to twenty feet in diameter, for any strength, for any speed and for any service for which belting can be used. It is a pulley that is quite in keeping with the other members of the famous Dodge Line of Power Transmission Equipment.

Do You Realize the Efficacy of Specialization?

In these days of hustle, specialization's the thing. Generalization means a waste we cannot afford.

Realizing this, some of you manufacturers have had lathes built of a capacity and design for just one class of work-specializing lathes. They do one thing and do it well. One of scientific management's greatest factors is the single purpose idea.

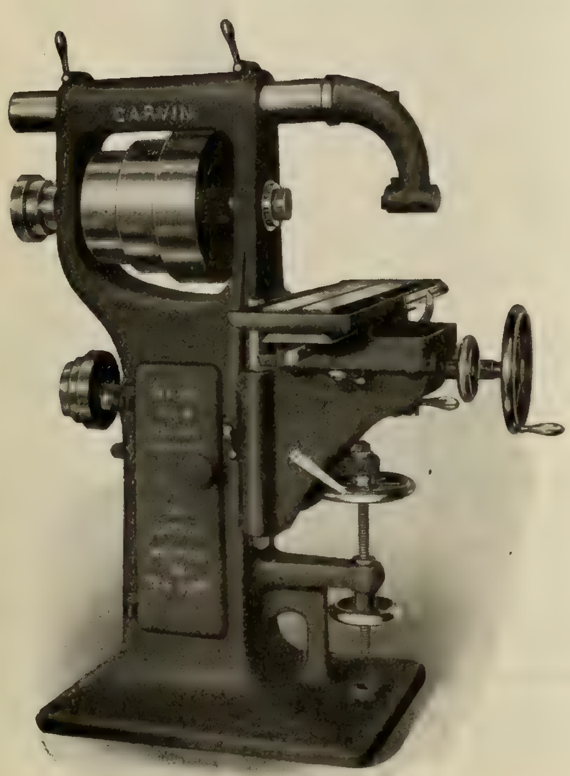
Now then—every HEALD INTERNAL GRINDING MACHINE is a specialist.

Take for instance HEALD Style No. 75 Hand Feed for Internal Grinding—built especially to grind short holes not over 2 inches or 2½ inches long, and furnished with draw-in-collet chuck which is rapid and efficient for most classes of work.

For you whose work includes grinding short holes, this HEALD is an essential, for of course you are after the utmost in economy and quality of work. Let us prove that a HEALD means this to you. Send us blueprints or samples and we will submit an estimate of guaranteed production on your work. Start matters by getting "PRACTICAL HINTS ON INTERNAL GRINDING," a booklet you would pay a quarter for if it were for sale. Sent free if you will write—NOW.

The HEALD MACHINE COMPANY
8 New Bond St. Worcester, Mass.

A GARVIN MILLING MACHINE FOR EVERY NEED



No. 21 Plain Milling Machine
Use Code . . . ABSORB.

Fully 80 per cent of the Milling Machines manufactured are used on manufacturing work, and a great majority of this 80 per cent. is used on what is called long set-ups. Did it ever occur to you that a simple Milling Machine without frills is made just as accurately as the so-called standard machine, and would effect a great saving in the first cost of your machine tool equipment.

Again, a less expensive operator can be used.

Think this over and investigate the merits of our No. 21 Plain Milling Machine. Made especially for manufacturing work and used by large concerns in gangs of six, to one operator.

Machines are simple and accurate, having lots of power, and enough feed and speed changes to take care of the work they are intended for.

Adjustments—18 x 6 x 13 inches.

A Valuable New Book on an Important Trade

PATTERN-MAKING

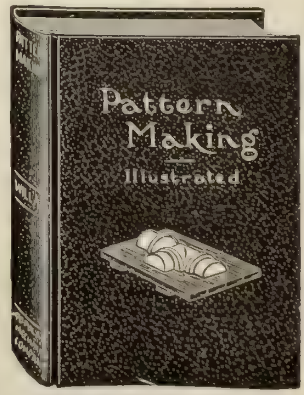
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations.
Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

Chapter Headings

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

Part II.—Core-Making and Molding.

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

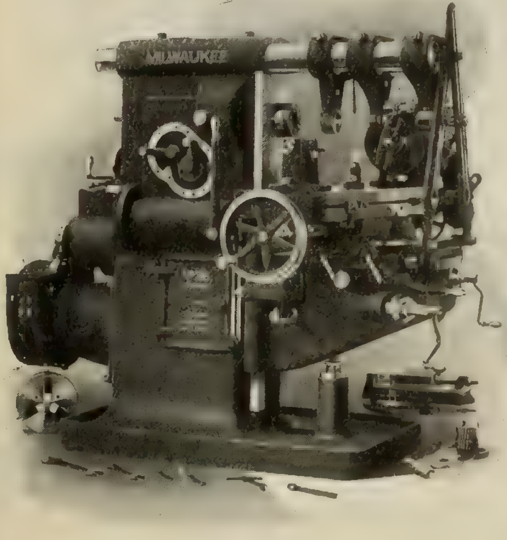
WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 4
Double Overarm

The rigidity of the arbor bearings measures the accuracy and the duration of usefulness of a milling machine.

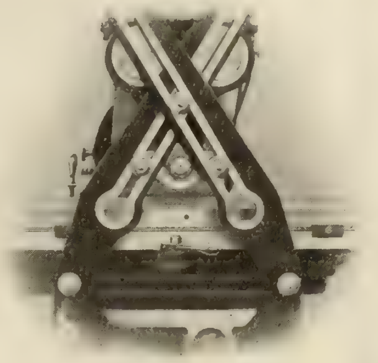


The Double Overarm construction is the most important step yet made toward perfecting this rigidity.

It consists of two steel bars arranged accurately parallel with the spindle, and at sufficient distance apart to form a rigid truss when the arbor bearings are clamped to them.

No longer is it necessary for the arbor to align the bearings, for the Double Overarms provide a means of aligning positively the cutter arbor.

The rigidity of this construction permits large, coarse-pitch cutters to be used on rough, heavy work at a much greater distance from the face of the column than has heretofore been practicable.



Each of these "WHYS" in favor of Milwaukee Millers is amplified in our bulletins. **If you are truly interested in finding the highest development in milling machine construction, write for a copy.**

ACCURACY

Accurate, high grade Cap and Set Screws should contain the following essentials:

1st.—Best Material.

2nd.—Uniformity of thread depth.

3rd.—Pitch accuracy.

4th.—Concentricity of thread with body.

5th.—Parallel sides of heads.

Galt Screws have all of the above cardinal points of quality. Try them and be convinced.

Big stock of Finished and Semi-finished Hexagon Nuts.

WELDING PLATES

A SCIENTIFIC CHEMICAL WELDING COMPOUND. WELDS IRON AND STEEL AT A REMARKABLY LOW HEAT.

You are not taking our products seriously enough; unless your blacksmith asks for it you never give it a thought. We can easily reach the smaller man who must consider every economy, but we cannot get at the man in your shop.

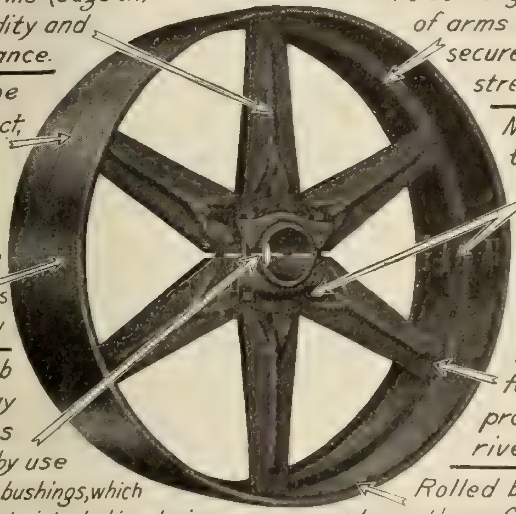
The larger you are the more you need LAFFITTE.

Let us send you samples. There are endless economies you can effect, and the cost is insignificant compared with the results.

DEALERS THROUGHOUT CANADA HANDLE LAFFITTE

The Phillips-Laffitte Co.
Penna. Bldg., Philadelphia, U.S.A.
ASK FOR AND GET LAFFITTE

A Double Belt Pulley—Proved by Actual Tests, Lightest and Strongest



Flat "A" braced arms (edge on) give perfect rigidity and least air resistance.

Grooved air escape improves belt contact, yet the face is not weakened.

Rim: One thickness of steel. Snugly doweled at the joints. Combines lightness with durability

Tight clamping hub eliminates key-way and set screw. Fits different shafts by use of interchangeable bushings, which are immovably fixed by interlocking device.

Inside flange, to which ends of arms are riveted, secures extraordinary strength and trueness

No need to strip the shaft. Fit two halves of pulley together, then tighten clamping bolts evenly.

Arm rivets do not go through face, with possible protrusion of rivets.

Rolled bead on rim, strengthens face at edge.

EVERY new size or style of "American" Pulley must undergo, in our testing room, a trial much more severe than it could meet under ordinary working conditions.

"American" Steel Split Pulleys

Perfect in Principle Powerful in Performance

are compared, in our testing room, with corresponding sizes of other pulleys. If the "American" does not show up *better* than and *others, it is not good enough* and the model must be improved.

In this way we have proved conclusively that "American" pulleys will stand up under greater strain than other pulleys, even those having much more weight. Correctness of design makes the "American" true and balanced.

We have sold over 2,000,000 "American" Pulleys. Less than 2-10 of one per cent. have been reported as failing to fulfill our guarantee of double belt service under any conditions, not requiring a special pulley.

Send for "Factors of Energy"—a booklet giving information and tables that every millman should have.

Geometric Screw-Cutting Die Heads Lead

They are in general use on Screw Machines and Turret Lathes.

Employed in cutting right and left-hand threads of standard or special pitch; also various special forms, such as the Acme, Metric, etc., as well as standard pipe threads.

The chasers are opened automatically, and there is no running back over the work after the thread is cut.

Geometric Die Heads

Can be furnished for cutting any size thread from the smallest screw up to the greatest diameter required.

Tell us your requirements, and we will recommend the Die Head.

NEW HAVEN, CONN.

Canadian Agents: Williams & Wilson, Montreal.
The A. R. Williams Machinery Co., Toronto.

The big things of the world are not done on black-boards.

¶ The young man just returning from college has allowed the idea to grow up in his mind that the world is clamoring for him with open arms—that people are gathering along the side lines to watch his going and coming. From the college campus he expects to step among business firms and men of affairs, either as a Diplomat to some foreign country, Manager of a Steamship Line, or as a Railroad Broker.

¶ The man who starts at the bottom is the man who learns the secrets that revolve around the principle on which the institution is founded. Dig deep enough toward the bottom of a thing and you will find the rock on which it stands. Most great men, men of influence and character, men who have acquired fortunes have once been poor. The man who has developed a great business, or the man who has developed great character, the man who has amassed great wealth, is the man who laid the foundation with his own trowel.

¶ No man can direct the policies or plans of a business until he knows the various channels through which money should be spent. No man can start half way up the scale and make the greatest possible success, because he can really never know what is going on under him. He is not familiar with what is being done "downstairs." Possible extravagance and error in one half of the business are unknown to him. A part of the very thing he is supposed to direct is a mystery, hidden away under the partition of inexperience.

¶ The things which have really bettered the world, improved humanity and added to our happiness, are the things born of inspiration, adversity, hardship and poverty. The President or General Manager of most every great business firm, the founder of every great idea, is a man who started at the bottom and who—from this small beginning—worked his way through the various departments, until finally he reached the greatest and highest position that the business could give.

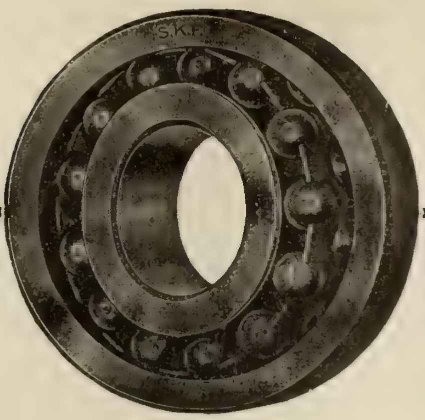
¶ The careers of most men are molded through the influence of someone who accomplishes much in this short span of busy years called "Life," and it is estimated that Andrew Carnegie developed at least forty of the biggest business men this country has ever seen, and that he also is responsible for at least a thousand independent fortunes.

¶ To begin at the bottom of a thing is an opportunity and it is from this vantage point that we see opportunity beckoning to us from the horizon of the future. *The stars are visible at noon-day to the man below the surface who looks up to discover them.*

¶ No cult will ever be founded to take the place of the school of experience. *The big things of the world are not done on blackboards.* Experience is the thing that gives us poise, power, personality—the thing that writes into our being that peculiar indefinable something that inspires confidence in other men.

Efficiency

These articles are copyrighted, and must not be reproduced in part or whole without the permission of The MacLean Publishing Company.



No User of Ball Bearings Can Afford to Neglect These Points

1. **Double Row of Balls**—virtually two bearings in one—a splendid feature under any load condition.
2. **Pressed Retainer in One Piece**—made from Swedish Lancashire Iron. No rivets, wires or screws to work loose, jam balls, disarrange spacing or make noise.
3. **Outer Race Spherical**—providing for a frictionless self-alignment that absolutely and automatically compensates for shaft spring.
4. **Best Swedish Crucible Steel**—Carefully heat-treated and uniform in hardness throughout. Unequalled for toughness, carrying capacity accuracy and durability.

SKEFKO

is the only truly self-aligning bearing. This feature alone is worth most careful consideration.

SKEFKO Self-Aligning Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

Observations on Bending and Welding Rolled Sections I

By Joseph Horner

The writer of this article, perhaps more than any others who have contributed to the editorial columns of the world's leading technical journals, is a recognized authority on workshop practice, whether the latter be the drafting room, pattern shop, foundry, machine shop or millwright section feature; and readers of "Canadian Machinery" engaged or interested in either of these branches of the mechanical engineering industry will find the regular occurrence and variety of subjects herein treated, helpful and instructive.

THE bending and welding of rolled sections differs in several aspects from the bending and welding done by the smith on bars and rods. It is complicated by the fact that rolled sections have webs standing in angular relations to each other—at right angles usually. When these are wide, and lie in the plane of bending, and the curves are quick, the metal is greatly extended on the outer radii and compressed on the inner. Crinkling and buckling occur in the bending of curves, while sharp angles cannot be turned, but the metal must be severed and made good by welding. Another point is that welding has to be done over large surfaces and over wide, but relatively narrow edges. This renders the making of sound lap or butt joints difficult, and gluts are frequently preferred. Again, the pieces of work handled are often large, awkward and heavy, which increases the difficulty of manipulation, so that various rigs-up are required. These also must be readily and rapidly applied, otherwise the metal would cool down before much work could be done upon it, and the number of heats would be increased and economy sacrificed. The process is considered the most difficult department of boiler work.

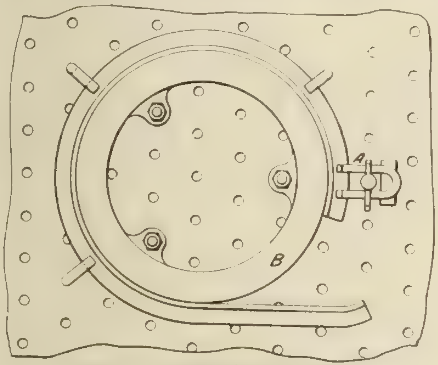

FIG. 2—BENDING A RING.

The Angle Smith.

A good angle-iron smith is exceptionally valuable in a shop, because, in addition to angles, he can perform work on such sections as tees, channels, etc., on tubular work, and other details in iron and steel which have to be bent and welded. The methods adopted are similar in all, as the broad flat portions have to be cut, bent and welded, and allowances made for the bending. Rolled sections can be bent and welded into almost every conceivable form, and it would be difficult to give a skilful smith a job within the legitimate range of engineering which he could not accomplish. The simplest cases which can occur are those that involve the formation of regular curves. Flat curves or those of large radius are very easily turned, but quick ones not so readily. Pieces that are bent at sharp angles cannot be treated without making welds at the corners, but angles of few degrees can be bent when uniting welding with bending by the methods here shown.

Only a comparatively small part of this work can be heated in a smith's fire. It can be done by rigging up a hollow fire of bricks, enclosed with plenty of fuel to make a "solid core" of heat, and taking short heats. This, however, is very wasteful of time, because a large ring can be turned at one heat if a reverberatory furnace is available. The smith's fire is suitable for heating ends to be welded, and gluts for welding, but not for long pieces of rolled sections.

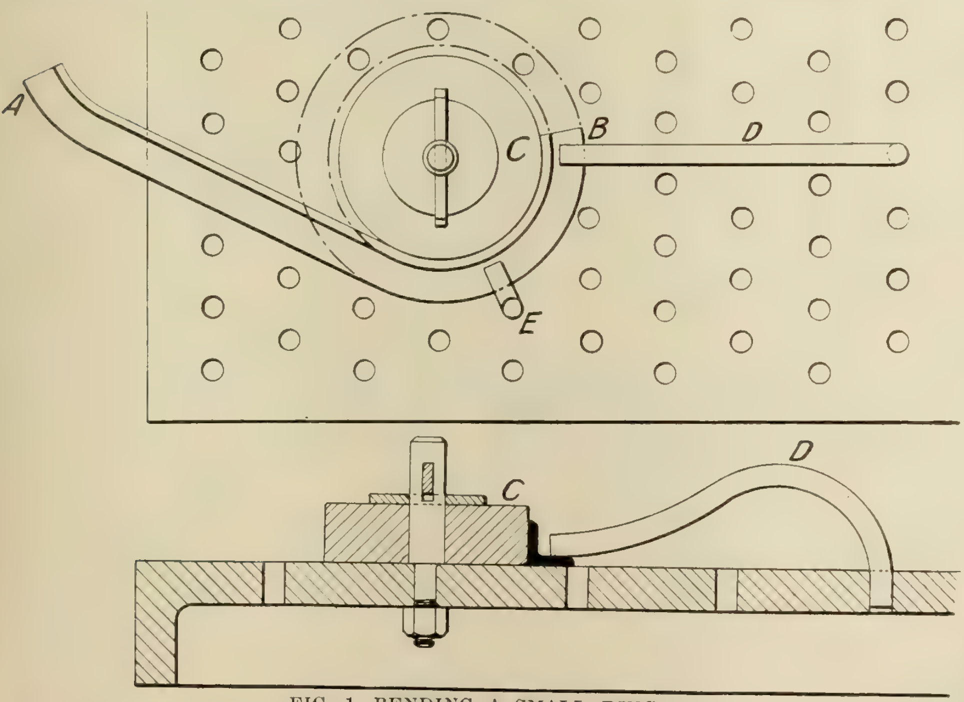

FIG. 1. BENDING A SMALL RING.

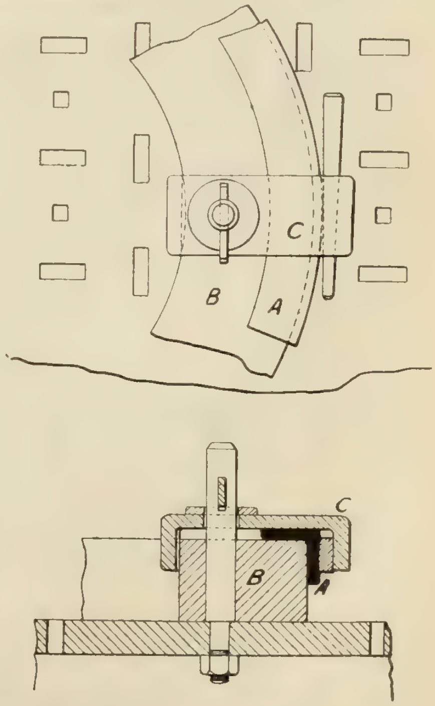

FIG. 3—METHOD OF CLAMPING A RING.

Rolled sections may be bent to form short curves connecting straight portions, into complete rings of small or large diameters, or into long curves of regular or irregular contours. Naturally only portions which have to be bent need to be heated. Bending is always accompanied by methods or securing, followed by correction on or around a block or blocks. The basis of such work is generally the shop levelling block, and it may in some cases be used alone, but usually another block around which the work is bent is bolted or cottered down on it.

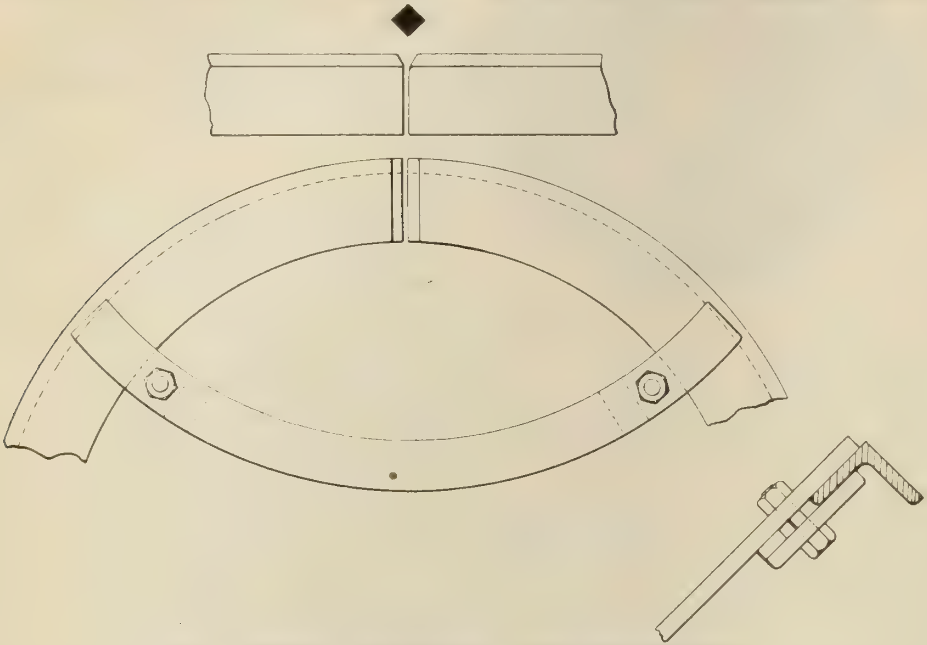

FIG. 4—METHOD OF HOLDING A RING FOR WELDING.

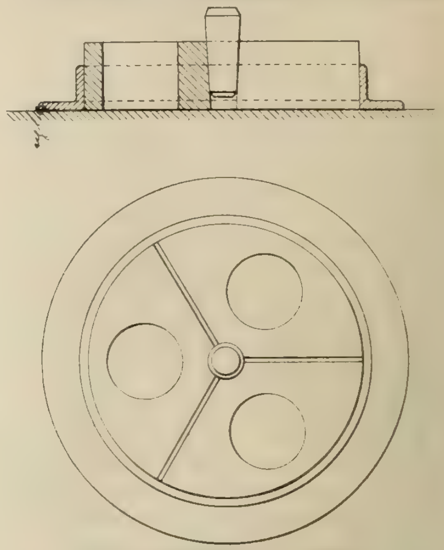

FIG 5—SETTING A RING.

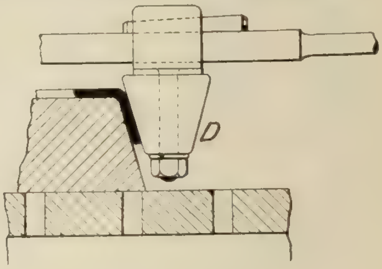
Bending Small Rings.

Fig. 1 illustrates a common piece of work, the bending of a small ring of angle section, such as would be used in the uptake of a vertical boiler. Before bending it to the circle, the ends (A) and (B) are heated and bent for a short distance to the curve, these being more easily done thus than subsequently. Then the whole length of bar is heated and rapidly pulled round the block (C), which is cottered down on the bending block.



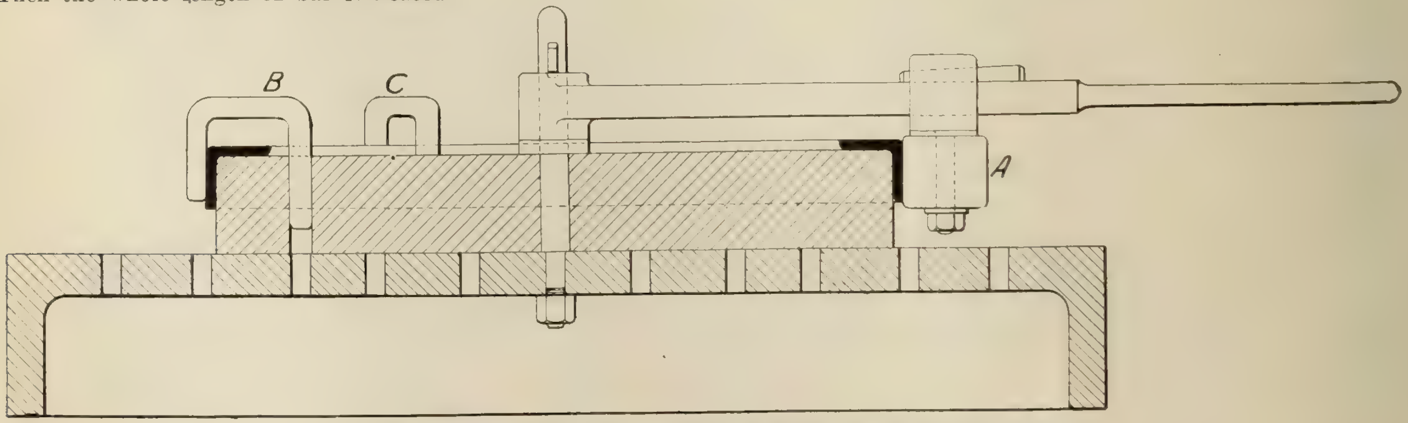


FIG. 6. BENDING AND CORRECTING A RING BY ROLLING.

First, the end (B) is gripped down by the holdfast (D), formed of a bit of rod bent round, or by other suitable means, as in Fig. 2, and the free end (A) is pulled round by angle-iron tongs, the jaws of which are shaped to grip the outside and inside of the angle. While one man pulls round, another delivers blows against the webs of the angles to remove the puckering that occurs, and to cause the webs to lay close to the levelling and templet blocks. Clamps like (E) or (D) are driven at intervals to hold the work down. When (A) has been pulled round to (B), the final setting is done with the sledge, and the ring is removed to receive the heat for welding. Welding is done by means of gluts, as shown in Fig. 4.

Bending Large Rings.

Larger rings, like that in Fig. 2, are bent with less difficulty, because less puckering occurs, and, therefore, less correction is required with the hammer. A single heat suffices for the bending. In this case an alternative clip is shown. It comprises a piece of iron bar (A), bent round into horseshoe form, resting on the web of the angle at one end, and a packing piece at the other, and held down with a cotter bolt. The templet block (B) is a ring only, with internal lugs, through which it is bolted to the levelling block.

One method by which an internal ring can be gripped on its bending block is seen in Fig. 3, where (A) is the angle, (B) the bending block, and (C) the clip. The latter is pulled down with a cottar bolt on a washer, holding the flat web down. The vertical web is held close up to the block by a wedge or wedges.

The Welding Feature.

When rings are being welded, all except the smallest must be secured, or the insertion of the glut would thrust them apart. A small ring like Fig. 1 is rigid enough not to require any help, but rings like Figs. 2 and 3 must have a strap to hold the ends together, one form being shown in Fig. 4. Nearly always the weld is of the glut form, as in Fig. 4, two separate gluts being required, one for each web, and each requires a separate heat. The glut is of the square section shown, or else of the vee form. It is heated at the end of a length of bar to form a porter, and cut off after the weld is made. Sometimes small rings have lap welds, but the glut is generally preferred and is more secure.

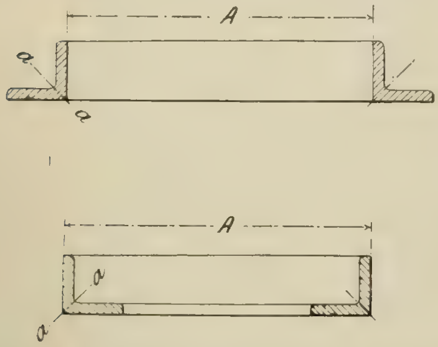

FIG. 7. MEASUREMENT OF LENGTH FOR RINGS.

When considerable numbers of small rings are being made, time is saved and uniformity in dimensions secured by taking a final heat after welding, and correcting and setting them around a templet, Fig. 5. This is not solid, because the cold shrunk ring could not be got off a solid centre. It is made in three pieces, with clearance, and with a central tapered plug, which, being driven in, opens the segments against the ring. The setting being then completed with the hammer, the removal of the pin allows the segments to fall inwards, and the ring to be removed.

A permanent rig-up for the bending and the after correction of the larger rings is shown by Fig. 6. Here a roller (A), adjustable along a radius bar, on which it is fixed with a wedge, is used to coerce the ring which is being bent. First, one end is secured with a clamp or holdfast, such as (B), in one of the holes of which numbers are cast in the bending block; then as the ring is pulled round by hand and the roller, other clamps as at (C) will secure it until the circle is complete. A radius-bar, like that shown, will serve for a large range of diameters by substituting fresh bending blocks. Rings of bevelled section can be turned generally well, by employing a conical roller and a block with an edge suitably bevelled, as at (D) in the upper part of Fig. 6.

Length of Bar for Ring.

To estimate the length of bar necessary to bend a ring of angle section it would not do to take the mean diameter of the ring, and multiply that by 3.1416. It would make the ring much too large. There are, however, several rules used in the shops, which all work out correctly within fine limits. In all cases, the thickness of the metal in the throat, measured diagonally at (a) (a) in Fig. 7, is a cardinal dimension, in addition to the diameter (A).

A correct rule is—to the interior diameter (A) add twice the thickness of the throat measured along the line (a) (a), and multiply the same by 3.1416.

For interior angles, from the exterior diameter (A) subtract twice the diagonal thickness on the line (a) (a), and multiply the sum by 3.1416.

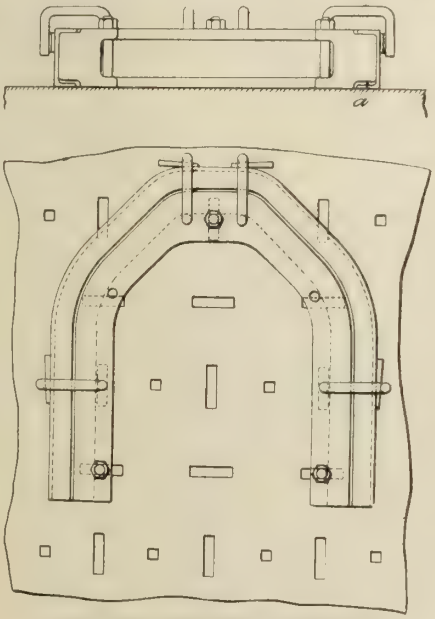

FIG. 10—BENDING CHANNELS

Bending to Irregular Curves.

When rolled sections are bent to curves that are not regular, the work is often done directly on the levelling block, Fig. 8, without any aid beyond that available from wedges, pins and packing pieces. This is shown in Fig. 8. The outlines of the curves required may be marked on the block, on a piece of plate, or a floor, to which in this case the work will be transferred and checked. When portions of bars are straight and portions curved, and the latter only are heated, the straight portions are pulled round readily by hand without using special tongs.

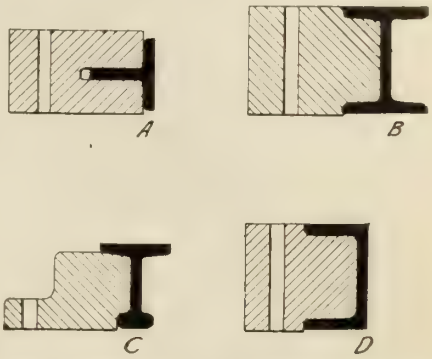

FIG. 9—SECTIONS THROUGH BENDING BLOCKS.

Block Features.

When sections other than angles have to be bent, suitable blocks can be made. Four of these are illustrated in section, Fig. 9, and comprise a tee (A), a joist (B), a rail (C), and a channel (D). Fig. 10 shows a block as made for bending channels to a particular shape for a job where some dozens were required. It is self-explanatory, being but an application of methods already described. Note that clearance is given at (a), next to the lower flange, without which the work would get fast on the block.

Although these examples all deal with work that is bent in a horizontal plane, it will be obvious that similar methods are adopted when for various reasons the bending is done in a vertical plane. The working edges of the blocks will then be uppermost, but cotters, clamps and wedges will be used as in these examples.

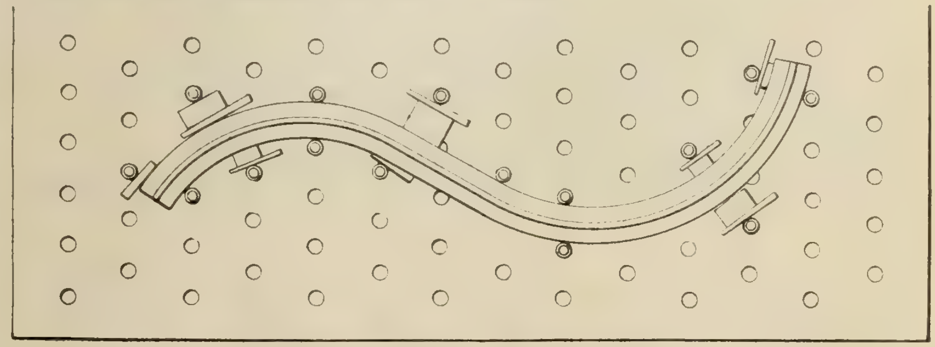

FIG. 8—BENDING ON A LEVELLING BLOCK.

LUBRICATING VALUE OF CUP GREASE.

AT a recent meeting of the American Society of Mechanical Engineers, Mr. A. F. Westcott read a paper upon the lubricating value of cup grease. In an able resume of the subject, he said that he had arrived at the following conclusions:—

(1)—Grease lubrication compares favorably with oil where the form of bearing is such as to favor the retention of the film of lubricant, and provision is made for an ample supply to the bearing; but oil will give better results in case of a short bearing in proportion to the diameter.

(2)—Grease of soft consistency is a much better lubricant than the harder densities of the same grease. The advantage of the softer grease is especially marked at low temperatures, such as usually obtained in a well-lubricated bearing.

(3)—The best method of applying grease to a bearing is by forced feed and a constant rate of flow. This agrees with the best practice in oil lubrication where the bearing is flooded with oil, which passes to a filter and is used again. The drawback in case of grease is in cleaning it after it has once passed through the bearing, so that it can be used again. Intermittent application of grease means irregularity in the value of the co-efficient of friction.

(4)—Grease cups with spring-actuated plungers are designed to give a constant flow of grease. They are far from accomplishing this purpose, however. Experiments upon grease consistency show what a great difference in flow is produced by a small change in the pressure upon the grease. A design of cup is desirable which will deliver the grease at a constant rate from the time it is filled until it is empty.

SMOKE INSPECTION SHAKE-UP IN CHICAGO.

CHIEF OSBORN MONNETT, of the Chicago City Department of Smoke Inspection, took the initiative, says The Industrial World, in a "house-cleaning" in his department recently by summarily discharging nine of his eleven deputy inspectors. The discharged men demanded a hearing on the charges preferred by Chief Monnett.

Mr. Monnett and Assistant Corporation Counsel Leon Hornstein have been supervising an investigation for some time, and have just completed the work on which the action is based. The nine deputies are under eight general charges, including petty graft, loafing, false reporting and insubordination, taking place in the last three years. The following are the charges against the deputies in detail:

1.—Disregarding the duties to which he was assigned, he spent much of his time, while he was believed by his superior officer to be on duty, at other pursuits not connected with his duties or with the department of smoke inspection.

2.—In making his reports he made misrepresentations in regard to the places where he was, the time when he was at work, and the manner in which he employed his time.

3.—He neglected to report violations of the ordinances relating to dense smoke when he knew that such violations existed.

4.—He made out reports at times when he was not actually on duty, but was supposed to be, charging violations of the smoke ordinances when none were observed by him at the time of making such reports.

5.—He used his official position to obtain favors from persons who were prosecuted or were liable to be prosecuted for violations of the ordinances relating to dense smoke.

6.—He visited engineers and others connected with the boiler rooms of buildings and conversed with them in regard to their duties, contrary to the rules of the department of smoke inspection.

7.—He sought to influence parties using coal, engines and boilers, concerning materials and appliances which they required.

8.—He conspired with other deputy smoke inspectors to cast discredit on the smoke inspector, and to bring the department of smoke inspection into disrepute as being inefficient and partisan.

Appliance Companies Involved.

Mr. Monnett indicated some of the charges he might substantiate at the hearing, in the following statement:

"We shall be able to show that two or three big coal companies and two or three big appliance companies were concerned in a conspiracy with the smoke inspectors we have suspended. This conspiracy has for its dual purpose the influencing of building owners toward the purchase of coal and appliances handled by the firms in question and the discrediting of the heads of this department in order that the inspectors might gain an even greater influence over factory and building owners.

"The accused men and the corporations whose names will enter into the hearings," said Mr. Monnett, "are very anxious that we should reveal, through the newspapers or otherwise, some of the specific incidents upon which we base our charges. We do not propose to give them such an advantage."

CANADIAN PIG IRON.

THE Bureau of Statistics of the American Iron and Steel Institute has received direct from the manufacturers complete statistics of the production of pig iron in Canada in the first six months of 1913. Every furnace has been heard from. Statistics for the whole year 1912 were also compiled by the bureau.

The production of pig iron in Canada in the first six months of 1913, including ferrosilicon and ferro-phosphous, amounted to 545,981 gross tons. The output in the whole of 1912 was 912,878 tons. The production of pig iron in the two halves of 1912 is not available. Of the total in the first six months of 1913, 532,481 tons were made with coke, and 13,550 tons with charcoal, coke and electricity, etc. In the whole year 1913, Canada will probably make over 1,000,000 tons of pig iron.

The production of basic pig iron in Canada in the first half of 1913 amounted to 292,625 tons, Bessemer pig iron, ferro-silicon, ferro phosphorous, etc., to 128,304 tons.

Of the 545,981 tons of pig iron produced in the Dominion in the first six months of 1913, 345,810 tons were delivered to mixers, open-hearth furnaces, etc., in a molten condition, 141,680 tons were sand cast and 58,491 tons were machine cast.

CANADIAN - AMERICAN POWER CORPORATION.

THE Canadian-American Power Corporation, which has been incorporated under the laws of New York, with offices at Niagara, by interests associated with the re-organization of the Buffalo and Lake Erie Traction Co., will be subsidiary corporation of the re-organized traction company.

The Canadian-American Power Corporation takes over a contract which has been made with the Electrical Development Co., Ltd., of Ontario, and the Toronto Power Co., Ltd., for the delivery of 46,000 horse-power of electrical energy by these companies at the international border. This contract will assure the re-organized traction company an abundance of power for the operation of its lines, and will leave a large surplus, which will be sold for lighting and power purposes in the territory between Buffalo, Rochester, Niagara Falls, and Erie, Pa.

The directors of the power company are: E. G. Connette, Buffalo; S. Reading Berton, Marshall J. Dodge and Francis T. Homer, New York, and Rodman E. Griscom, Philadelphia.

Elements in the Manufacture of Frictionless Bearings*

This article describes the methods employed in the manufacture of ball and roller bearings, and gives prominence to the important part played by grinding equipment in the attainment of high degree uniformity, desired accuracy and quality of product.

IN this modern age of process and development it would seem that a limit had almost been reached where the inventive genius might deservingly cease from his labor and take a well-earned rest. During the past quarter of a century this development has been so rapid and pronounced that even the most optimistic are forced to stand aside and consider with amazement the phenomenal accomplishments of the past and the tremendous possibilities of the future.

Scientists and inventors are devoting their whole time and energy in attempting to fathom the seemingly impenetrable forces of nature. They have already transformed electricity, one of the most mysterious elements of the universe, from a terrible master into a valuable servant, and they have harnessed and controlled vast cataracts of water for further developing this wonderful force for the use of man. A hundred-and-one instances might be enumerated where science has mastered natural forces, yet we are still only at the beginning, and cannot begin to foresee what the future will bring forth.

Friction Elimination.

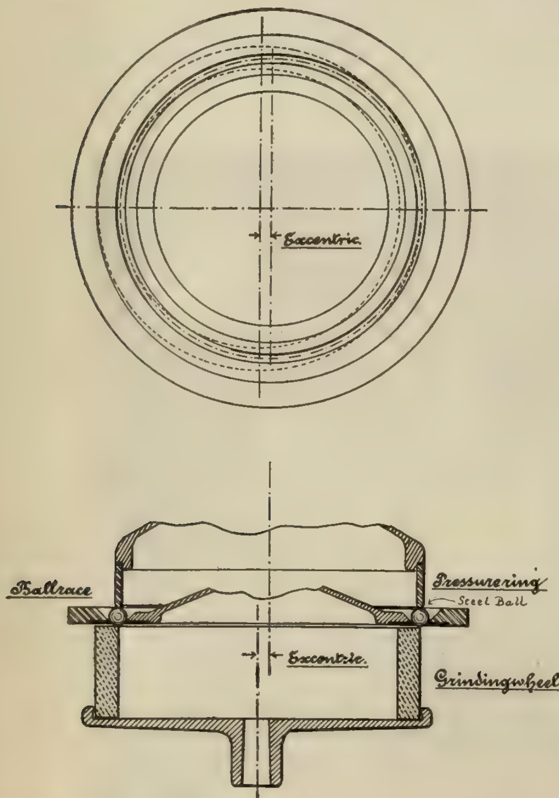
If we go back into history a hundred years, and compare that time with the present, it will give us some idea of what the world will be like in a hundred years from now. It must be so, for one of the immutable laws of nature is motion, and there must be no quiescence. So it is, then, that as conditions on this planet improve, there must be a like development along economical and mechanical lines.

It is in the mechanical world that the greatest progress has been made in an effort to keep pace with modern requirements, which are focused in a demand for efficiency coupled with economy. So it is readily seen that the elimination of friction is a most potent factor towards higher efficiency. The necessity for obtaining the greatest amount of power from the energy expended, and applying it to the work in hand, has forced the mechanical world to introduce and develop machinery which will reduce or eliminate friction, and this is where we come to the subject of this article—the manufacture of frictionless bearings.

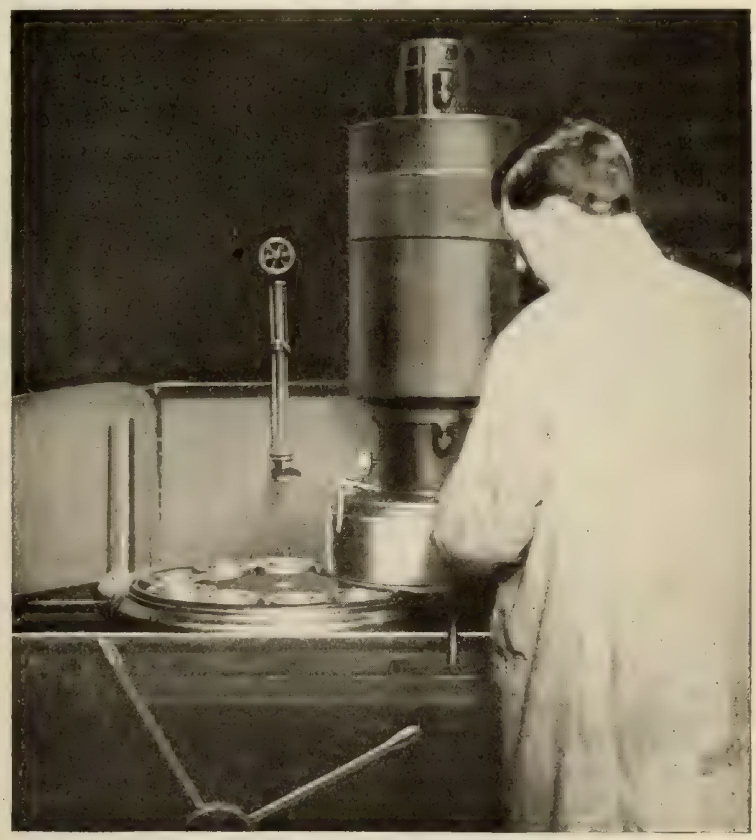
A Growing Industry.

Frictionless bearings first entered the mechanical world as a staple product about twenty-five years ago, although, for years before, they had been used in a more or less experimental way for various purposes. The possibilities of frictionless bearings were first disclosed when they were used in the manufacture of the bicycle, now there is scarcely a piece of machinery made without having frictionless bearings as component parts. The sliding doors in your home, the street car, train, or automobile which carries you to your office, the swivel chair upon which you sit and the typewriter you operate, are but a few of the thousands of things which contain ball or roller bearings, and they are all there for the same purpose—to eliminate friction and to gain efficiency.

In order to obtain a general idea of the methods and processes used in the manufacture of frictionless bearings,



THE LOWER SKETCH SHOWS THE PRINCIPLE OF THE BALL-GRINDING MACHINE; THE SKETCH ABOVE SHOWS THE ECCENTRIC MOVEMENT OF THE GRINDING WHEEL.



FACING BRONZE BALL CAGES ON A BLANCHARD HIGH-POWER SURFACER.

---

*"Abrasive Age," Carborundum Co., Niagara Falls, N.Y.

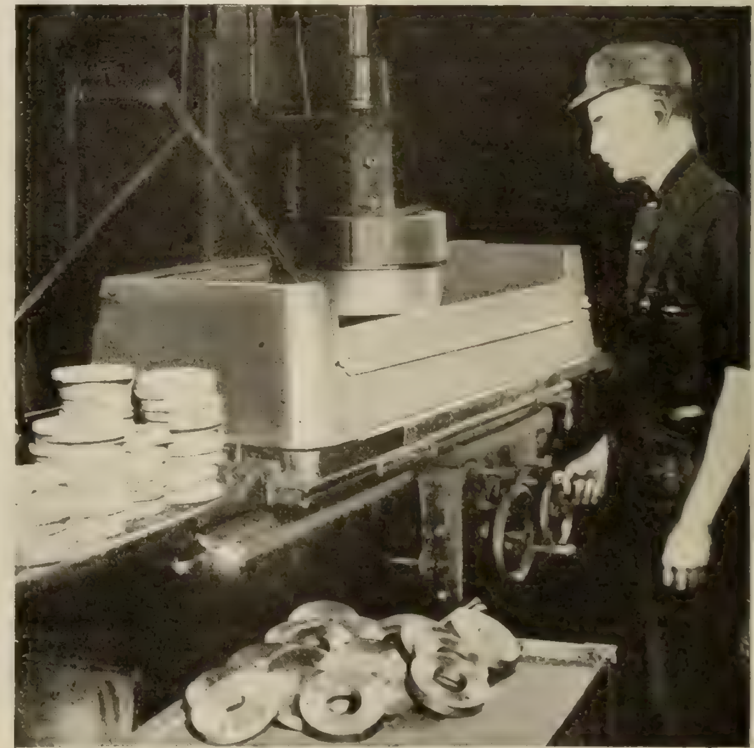
the writer recently visited several of the most up-to-date shops in the country and was enabled, through the courtesy of those in charge, to obtain some interesting data. Formerly, there was a great deal of secrecy exercised in connection with the manufacture of ball bearings, but this secretiveness is gradually passing away as more and more the importance of co-operation is being realized. In this article, we shall describe in a brief, but concise way the different types of bearings made, the manufacture of the steel balls used in ball bearings, the rollers for roller bearings, and the bearings themselves, paying particular attention to the most important operation met with—that of grinding.

GRINDING A CASE HARDENED SLEEVE ON A LANDIS UNIVERSAL GRINDER.

Types of Bearings.

There are two general types of bearings in use, familiar to every worker in the mechanical world, namely, ball and roller bearings. The ball bearing, which gives a point contact, is used where the load to be sustained is not very great. The roller bearing, with its lineal contacts, is used for sustaining very heavy loads. Ball bearings are made in two general types, namely—"radial," where the balls travel between the outer and inner circumference of two grooved rings or raceways, and "thrust," where the balls travel between two grooved or ungrooved discs or plates. The balls are contained in a brass, bronze, or steel cage, and these different parts, the balls, cage, and raceways, constitute the members of a ball bearing.

Roller bearings consist of a series of rollers contained in a cage or sleeve and a thin band of steel called the separator, which keeps the rollers from touching each other, thus reducing the possibility of friction to a minimum. These bearings are much easier to manufacture than the ball bearings, owing to the ease with which all parts can be handled.



GRINDING CASE-HARDENED RINGS OR COLLARS ON A VERTICAL WET GRINDER.

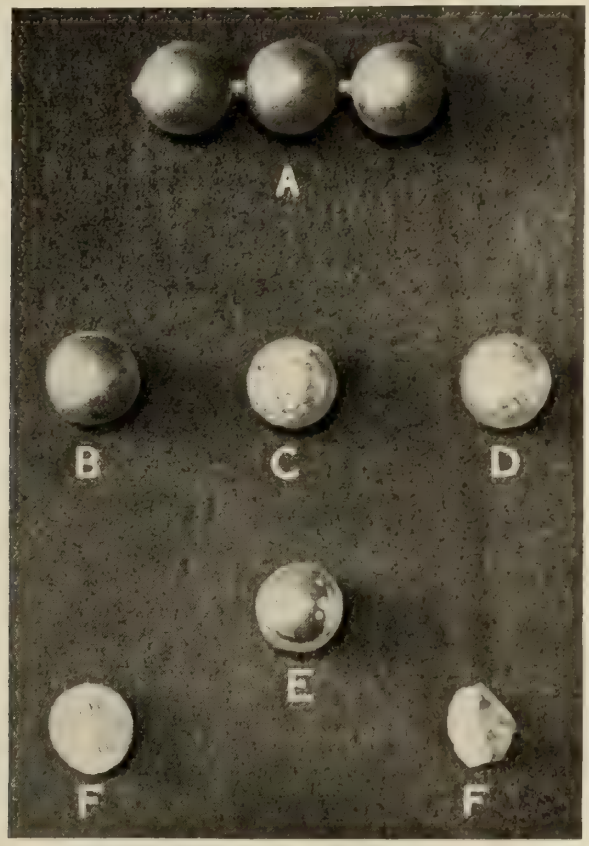
The "thrust" roller bearing consists of a series of rollers running between two grooved or ungrooved steel collars, and is designed to relieve heavy side pressure at not too great a speed. The rapid growth in the manufacture of frictionless bearings has brought forth many new types for special purposes, but, in every case, the principle is the same, the object point being the elimination of friction so as to ensure speed, long wear, and durability.

Making the Steel Balls.

The highly polished steel balls of marvelous accuracy are easily the most important part of a bearing, and before they reach such a desirable state of perfection they have to pass through a number of processes, each carried out with the same exactness and attention to detail. The first process, of course, is the selection of the steel from which the balls are forged. After forging, they are cut and trimmed, rough ground, hardened, smooth ground, lapped, polished, and finally graded. We will describe each of these processes in order, with particular attention to the part of the grinder in the evolution of the steel ball.

Selecting the Steel.

It is very important in the manufacture of the balls that the very best steel for the purpose be secured. Formerly, chrome steel was used extensively as it was found to be fine grained and very hard, but tests showed that it deteriorated more rapidly than ordinary steel, and most of the manufacturers are now using carbon and alloy steel, which answers the requirements satisfactorily. As it arrives at the factory from the mill, the steel is in bundles of round rods of various lengths and diameter. These are sorted, and then placed in convenient racks ready for use. The steel rods are always chosen a little under the size of the ball to be made, so that there will be no loss in forging. In swedging, or forging, the stock upsets to full size.

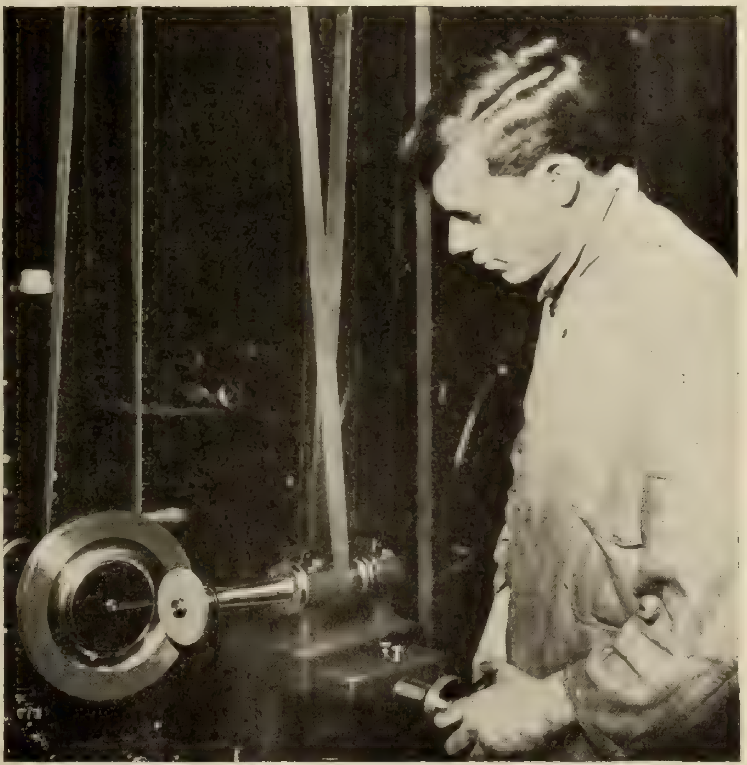


EVOLUTION OF A STEEL BALL.
(A) shows the string of balls as they leave the forging machine; (B) shows appearance of ball after being hardened; (C) is the ball after rough grinding; (D) shows a smooth ground ball, and (E) is the finished or polished ball; (F) shows sections of balls fractured under the hydraulic press to test for grain and strength.

The Forging Process.

The most common method used in forging the balls is what is called string forging. Rods of steel about six feet in length are taken and fed into a special machine having hydraulic presses and dies, and fitted with a furnace-heating attachment. The rods travel slowly through the heat flame until they are almost white hot, when they pass into the dies under the hammers, and are forged into spherical shape.

Those machines for making the very small balls have an automatic cutting attachment, which cuts the balls from the string as fast as they are forged. In this manner, balls are forged and cut at the rate of 150 per minute. The larger-sized balls, from ¼ to 3 inches in diameter, or even larger, must be forged on a trip or drop hammer, then the flash is trimmed on a trimming press, which consists of a series of punches which force the balls through steel plates or dies having holes the same diameter as the balls. As the machine is working, the balls drop individually into a receptacle placed underneath, and are then taken to the grinding room for their first or rough grinding.



GRINDING OUT BALL RACEWAYS ON A DRY RADIAL GRINDER.

Rough Grinding.

The main purpose of the rough grinding is to remove the scale or decarbonized shell surface which the forging produces. During recent years, the machines used for this purpose have been greatly improved, and while the machines in some shops have special features which distinguish them from others, yet there is not a great deal of difference in the principle. It is readily understood that accuracy in this important operation is absolutely essential. the balls as they leave the forging machine being but a few thousandths of an inch over size.

In the ball-making plant of the Smith Premier works at Syracuse, N. Y., where all the balls used in the type lever bearings and carriage bearings of this well-known typewriter are made, the writer obtained his first insight into the manufacture of steel balls. This plant is up-to-date in every respect, and is in charge of some of the best experts in ball making in the country. Here, balls ranging in size from 3-32 of an inch up to 5-32 of an inch are made. Another plant in Syracuse which is equipped with the most modern types of ball-grinding machines, containing exclusive features introduced by the firm itself, is that of the C. I. Lipe Co., also in charge of ball-making experts. At this plant, balls from 3-32 of an inch in diameter up to four or even five inches in diameter, are made.

In addition to manufacturing the ordinary steel ball, the Shatz Manufacturing Co., at Poughkeepsie, N.Y., also make hollow balls for bearings, which are in great demand where bearings for light machinery are required. These balls are pressed from steel, brass, copper, bronze, and monel metal, in halves, and then welded together by electricity in special machines, and it is claimed they are just as serviceable as the solid balls. After welding, these balls go through precisely the same processes as followed out in producing the solid ball.

The Grinding Machines.

Almost all the ball-grinding machines are of the upright spindle type, the accompanying sketch showing the principle used. The balls are located in a race consisting of two hardened steel rings made up of segments, so as to allow the balls to be touched by the face of the grinding wheel. Above the ball circle is located a revolving pressure ring, which travels in an opposite direction to the ball raceway. The grinding wheel is placed eccentric to the race, so that when the balls touch the inner edge of the grinding ring, on the one side, the balls on the opposite side are being ground on the outside edge of the wheel. This gives the balls a continual rolling motion, and insures a perfect sphere in grinding.

It is most important that all the balls in the circle touch the surface of the grinding ring, and only a slight pressure is needed to grind them. Another important point is that the eccentric location of the ball race to the grinding wheel has to be half the thickness of the grinding wheel or ring. For instance, if the grinding wheel or ring used is 12 inches in diameter and 2 inches thick, the diameter of the ball race has to be 10 inches, and the centre distance of the ball race to the centre of the face of the grinding wheel is 2 inches.

Owing to the fact that the machines for grinding must be absolutely accurate in every detail, they can be made only by an expert having years of experience in the manufacture of steel balls. A machine poorly designed and constructed could never grind steel balls to accurate roundness, but a well-designed and constructed machine will rough grind balls to a limit of accuracy of less than a half-thousandth of an inch.

Of equal importance to the good design of the grinding machine is the grinding wheel itself, which must cut clean and fast, hold its shape, and show long life. At the C. I. Lipe Co's. plant in Syracuse, special tests were recently made; on one of which 52 balls ¾ inch in diameter were ground in 20 minutes, removing .030 of stock, by an Aloxite wheel, 14 inches diameter, 4 inches thick, with 12 inch arbor hole, and 30 grit.

After being rough ground, the steel balls then receive a special heat treatment in which each ball is subjected to exactly the same treatment during the same period of time and at the same temperature. This is carried out automatically in special furnaces with the degree of heat constantly indicated and recorded by means of pyrometers.

Uniform treatment is the most important factor in the manufacture of high-grade steel balls. The balls are plunged into a hardening fluid as they are ejected automatically from the furnace through a closed channel, to prevent them coming in contact with the cool air. This channel is in the form of a spiral, and by the time the balls drop into the hardening fluid, they are in a sufficiently cooled condition.

The balls after being hardened are then tested to determine the condition of the grain and their resistance to crushing loads. A ball is selected from a batch and fractured under a hydraulic press, the pieces being closely examined by experts to see if there are any defects.

It is not generally known that a fairly high-grade steel ball can be produced from low carbon steel, such as cold rolled steel. In order to obtain good results, however, the heat treatment must be given careful attention. The process is as follows: The balls after rough grinding are carefully packed in hydrocarbonated bone or other good carbonaceous material, and placed in a cast-steel pot; first a layer of bone and then a layer of balls, until the pot is full. It is then carefully luted with fire clay.

The boxes are then placed in the carbonizing furnace with a uniform circulating heat on all sides. The heat is gradually raised to 1,550 degrees Fahrenheit, and held at that temperature by the use of pyrometers for sufficient length of time to secure deep penetration. The pots are then removed from the furnace and allowed to cool, after which the balls are reheated to 1,500 degrees and plunged into running cold water. From this point, the balls receive the same grinding treatment as the balls made of alloy or carbon steel. It may be stated here that the carbonized ball in many cases lasts longer than the so-called higher grades.

Smooth Grinding.

The next process is that of smooth grinding the balls down to about one and one-half thousandths above the exact size. This is done on another special machine having a very fine grit grinding wheel, on the same principle, however, as the rough grinder. In this machine, the balls receive a very smooth surface, and are less than .0002 of an inch out of round. The life of a grinding wheel in these machines is extraordinarily long.

In the Smith Premier works, a wheel 11½ inches in diameter, 3 inches thick, 6½ inch arbor hole in 70 grit is being used successfully for smooth grinding balls 3-32 of an inch in diameter. Two hundred of these balls are ground at a time, and, with two machines, one operator can grind 70,000 in a working day of nine hours.

The Lapping Process.

The final grinding operation is that of lapping, and this is done on special machines where the balls receive the smoothest surface and a perfect roundness. The principle of construction is the same as the rough and smooth grinders, except that in place of the grinding wheel or disc, a plain steel disc is used. Thick black oil is run into the ball raceway and the abrasive generally used is of 120 grit or finer. The lapping machine operator has to be constantly on the alert with his micrometer, and know exactly how long to run the machine in order to round the balls true to size, and the abrasive grain must be absolutely uniform in its cutting qualities.

Polishing the Balls.

The final operation is that of polishing the balls in a barrel-shaped machine, in which the balls are tumbled for a certain length of time. This gives them that beautiful mirror-like finish, and after being sorted and inspected they are ready for assembling in the bearings.

How the Rollers are Made.

The rollers for the roller bearings go through processes similar to those used in making the steel ball, except that the rollers are ground on an ordinary grinding machine. These rollers are received in the form of alloy steel forgings and after being hardened by packing in bone for twenty hours, they are ground all over. The first grinding is done on a Norton 6 x 32 plain cylindrical grinder, and they are then ground at the sides on a Blanchard wet vertical grinder. For the latter operation, the rollers are held in a special cage or jig carrying forty rollers at a time, which is then attached to a revolving chuck. The amount of stock to be removed is between .010 and .012, and with an Aloxite wheel, 16 inches in diameter, 1½-inch wall, 12-

inch arbor hole, in 80 grit, 400 of these rollers are ground in a single day.

Ball and Roller Bearings.

We will now describe the various processes used in the manufacture of the bearings themselves. The material for the outer sleeves or box rings arrive at the factory in the form of drawn tubes of nickel steel from eighteen to twenty five point in various sizes. The inner rings and collars come in the form of separate weldless steel forgings. They are machined on automatic lathes, sufficient stock being left for grinding. Collars for thrust bearings are usually blanked out of nickel steel, and these, with the bronze or brass cages, also come in a variety of sizes.

Hardening Treatment.

The next process is that of carbonizing or case-hardening, and this also must be very carefully carried out if satisfactory results are to be obtained. Gas or oil-heated furnaces of the latest type are used, equipped with pyrometers, by which a uniform degree of heat is maintained. The hardening process consists of packing the rings or collars in iron crucibles, surrounded and separated by bone packing. These are subjected to a heat of 1,650 degrees Fahrenheit for a period of from fourteen to twenty hours, according to the depth of hardening required, and the thickness and diameter of the work. The usual depth of hardening is 3-32 of an inch. After being hardened, they are ready for the grinding operation.

At the plant of the Railway Roller Bearing Co., Syracuse, N. Y., the outer rings are face ground on a Blanchard vertical grinder, the work being held on a revolving magnetic chuck. The machine is equipped with an Aloxite wheel 16 inches in diameter, 1½ inches thick, 5-inch arbor hole in 40 grit. The amount of stock to be removed is .008, and the wheel is run at a speed of 1,000 r.p.m., the work-table speed being 13 r.p.m. Figures on the number of collars ground per hour or day were not available.

The outer sleeves, which contain the cage and raceways, are ground on a Bath Universal grinder, the work being clamped in position on a steel face plate. For this grinding, Aloxite wheels 3½ inches in diameter, 1 inch thick, ¾-inch arbor hole, in 40 grit, are used. The amount of stock removed is .015 and the wheels give every satisfaction because they cut clean and fast, and do not glaze.

The inner sleeves are of nickel steel, case hardened. After being machined to a near size, they are ground on the outside, inside, and on both ends on a Bath duplex grinder. A sleeve having an inside diameter of 4 inches and 12 inches long, and with .015 stock to be removed, is successfully ground to a desirable finish with a wheel 3½ inches in diameter, 1 inch thick, ¾-inch arbor hole, 40 grit in 30 minutes. Grinding figures on sleeves of lesser size were not available.

Thrust Bearings.

It is essential that the collars for thrust bearings have both surfaces well finished and in the same plane. These bearings are made in all sizes from less than ½ inch, up to 12 inches in diameter, and for special purposes even larger than that. When taking thrust both ways, there is, of course, a double case of balls or rollers. The grooved collars contain a groove the radius of which is slightly larger than the diameter of the balls, the one great advantage of the grooved bearings being that they will take care of a much greater load than the plain bearings. The manufacture of roller bearings is not so difficult because all parts, including washers, cages, and rollers, can be easily handled and rapidly ground. Roller bearings with their lineal contact will sustain a load from four to five times heavier than a ball bearing of the same diameter.

In grinding bronze cages, a number of these are placed on a revolving chuck in a vertical grinder and all ground in one operation. For this purpose a carborundum wheel 16 inches in diameter, 1½ inches thick, 13½-inch arbor hole in 241 grit, has been found to give every satisfaction. The cages are roughed with the work-table reading 44 r.p.m. From 24 to 35 of these cages are ground to a desirable finish in a single hour.

Steel collars are ground in the same manner as the bronze cages except that instead of using a Carborundum wheel, Aloxite is used. A test was made recently in grinding collars 2⅝ inches in diameter, 1 15-16 inch hole, when a wheel 12 inches in diameter, 4 inches thick, 8⅜-inch arbor hole in 40 grit ground 50 of these collars, surfacing both sides to a desirable finish in 19 minutes, with a wheel loss of but 1-32 inch.

On a vertical wet grinder, a cup wheel 8 inches in diameter, 3 inches thick, 4-inch arbor hole with a ½-inch wall and back in 403 grit, was grinding case-hardened steel collars 2⅝ inches in diameter, 1 15-16 inch hole at the rate of forty-nine in 15 minutes. Both sides of the collars were ground, the wheel loss being 1-30 of an inch.

An interesting operation is that of grinding out the grooves or raceways in steel collars. First of all the groove is machined out, leaving a few thousandths of an inch to be removed by the grinder. Two hundred raceways in 6-inch diameter collars with a 4½-inch hole, were ground to a desirable finish with a cup wheel 4 inches thick, 1-inch arbor hole in 60 grit. The wheel was run at a speed of 3,128 r.p.m. on a Landis grinder. Raceways are also ground on the Brown and Sharp annular or radius grinder, which is specially adapted for medium and large work and insures increased production. For instance, 9-inch steel collars, ⅞ of an inch wide are ground with a wheel 4 inches in diameter, 5-16 of an inch thick, ⅝-inch arbor hole, in 60 grit. The wheel speed is 9,000 r.p.m., and the work is ground rapidly and to a good finish.

At the plant of the Bantam-Anti-Friction Co., Bantam, Conn., the grinding equipment is most up-to-date, the very best machinery being insisted upon for turning out these well-known bearings. Here, raceways of ¾-inch radius in 6-inch steel collars are ground with a wheel 3 inches in diameter, ¼-inch thick, ⅝-inch arbor hole in 80 grit, removing .008 stock. For smaller bearings of the radial type, containing 3½ per cent. nickel steel, a wheel 1 inch in diameter, 3-16 inch thick, 3-16 inch arbor hole in 60 grit is found to give an excellent finish. On some of the stock ground on a Heald wet grinder, a wheel 2 inches in diameter, ⅜ inch thick, ⅜-inch arbor hole in 60 grit was found to be the best ever tried for grinding raceways. This wheel increased the production 150 raceways per day.

BENDING CAST IRON PIPES.

AN interesting account is given in the Engineering Record of a method of bending cast iron pipes carried out on a pipe-line from the Guayabo River to the town of Preston, in Cuba. The place where the curved pipes were required was a remote one, and as, through some oversight, straight pipes had been delivered instead of curved ones, it was decided to bend these, if possible, rather than delay the work until other pipes could be cast and delivered. The curves to which the pipes had to be bent varied, the shortest being 50 ft.

A cradle of old rails was first constructed, having the desired amount of curvature, and on this the pipes were laid, about one foot at each end projecting beyond the cradle. A fire of hard wood was then built up round the pipes, six or eight pipes being treated at one time. In 1½ hour to 2 hours after starting the fires, the pipes were hot enough to bend, and they settled down from their own weight on to the cradle prepared for them. The particular pipes treated were 10 in. diameter, the thickness of the shell being 9-16 in.

HARDENING AND TEMPERING.

By Frank Walker.

WHEN hardening very thin articles of carbon steel, such as safety razor blades, small slitting saws, or special shear blades, great difficulty will be experienced in order to prevent warping if they are quenched in water. Water is not an indispensible medium for hardening, it only being necessary that the article, when heated to the right temperature for hardening, be suddenly cooled, in order to set or trap the carbon in its changed or hardening state. For thin, flat articles, pressure on a cold surface will be found to act as effectively for the purpose as quenching in water.

Apparatus and Process.

The simple apparatus shown in the sketch, Fig. 1, will be found to fulfill all the requirements for the class of work. It consists of two parts, the block which has a water cooled face as shown, and the pressure plate which has a handle by which it is pressed down upon the work. The faces of both must be machined to a plain surface.

The article to be hardened should be heated on a flat plate placed over the fire, and, when at the proper heat be transferred as quickly as possible to the block, the plate being instantly pressed down upon it, and held firmly as long as one may count ten, for an article 1-64-inch thick. This will be found to harden the article quite as efficiently as quenching, and without a possible chance of its warping. This process may be employed for articles up to 1-16-inch thick, but for those 1-64-inch thick, it will be found better to keep the faces of the block and plate smeared with a thin coating of oil.

Drawing the Temper.

When drawing the temper, the articles should be stacked together like a pack of cards in convenient quantities, and cramped between two steel plates, which should be faced true and polished. Figs. 2 and 3 show the method of holding square or round articles, the projecting shank being for convenience of holding them by means of tongs. They should be heated in a muffle—a piece of 6-inch wrought-iron pipe placed on a smith's forge, and the fire well banked up round it, makes a very good substitute, heating them slowly and turning frequently until the desired temper color shows on the polished surface of the cramp plates. Fix afterwards in the usual manner by quenching in cold water. The cramps should be cleaned and re-polished after each operation.

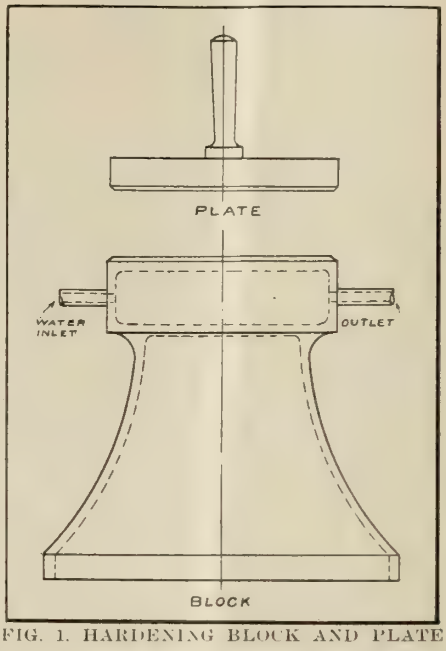

FIG. 1. HARDENING BLOCK AND PLATE

Articles as thin as 0.004 inch may be successfully hardened and tempered with this method by a quick operator.

TWO QUICK REPAIR JOBS.

By J. H. W.

ON A recent voyage of the twin screw Allan Liner "Hesperian" from Glasgow to Montreal the port engine failed on the second day out, and investigation showed that the low pressure crank had broken in the main after bearing. The break took the form of a spiral, and extended about three-quarters way round the shaft. The voyage was continued with the starboard engine only, and Montreal was reached without further incident two days behind schedule. A message had been dispatched from Father Point to the Hall Engineering Works, Montreal, asking them to be prepared to commence work on the repair immediately the vessel docked. Mr. Thomas Hall, managing director, and his chief assistant, Mr. W. Fletcher, personally supervised the work, which consisted in replacing the broken crank with a spare one carried on board.

At first sight this does not seem to be a very lengthy job, but it must be remembered that it involved the removal of the engine room gratings as well as a large amount of auxiliary piping. The broken crank had to be uncoupled, the bearings taken out and the connecting rod removed. The crank, which weighed 8 tons, was then lifted out.

The spare crank was being carried upended in a corner of the engine room, and being in a rather awkward position, it had to be very carefully handled on account of its proximity to a fan engine and a Weir pump. However, it was successfully raised by means of blocks and jacks and placed in position in the bearings. It was then lined up, the holes for the coupling bolts reamed out, and new bolts fitted. After the crank had been coupled up to its neighbor, the connecting rod was replaced and adjusted, and all auxiliary piping, etc., put back in position. Work was carried on day and night, about twenty men being employed. The Hesperian docked on Thursday morning, July 17, and the repairs were completed by the following Sunday night. It will generally be admitted that this constitutes a remarkably good per-

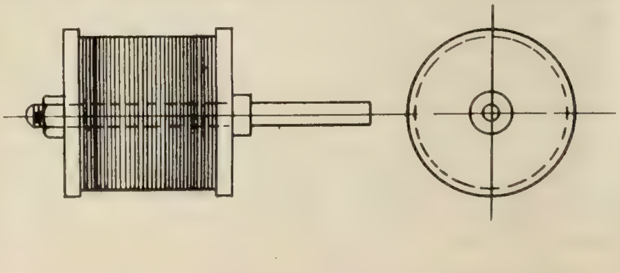

FIG. 3. METHOD OF CRAMPING SLITTING SAWS.

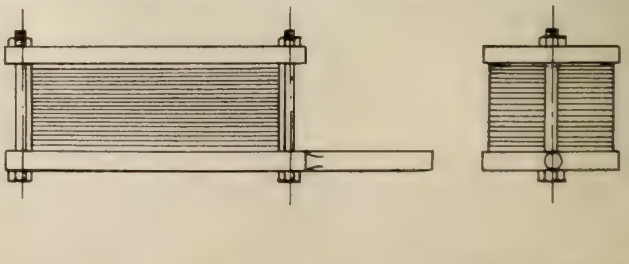

FIG. 2. METHOD OF CRAMPING SHEAR BLADES.

formance, and one that reflects credit on the Hall Engineering Works.

S.S. Comet.

This company also recently effected a very quick repair to the S.S. Comet, of New York. The Comet is a new tank steamer belonging to the Standard Oil Company. On July 22 last she arrived at Montreal with all four blades of her sectional bronze propeller badly bent through striking a dock wall. Repairs were carried out in the short space of ten hours without putting the vessel into dry dock.

She was tipped by filling her fore peak and forward tanks until the propeller was out of the water. Three of the blades were then removed and taken ashore to the shops of the Hall Engineering Works to be straightened. The fourth was left on the boss, it being found feasible to straighten it in position by means of hydraulic jacks and hammers. Notwithstanding the fact that the blades were very much bent the whole of the work was completed between 10 a.m. and 8 p.m. of one day.

CIRCULAR BROACHING FIXTURE.

By A. L. Monrad.

In many shops it is found to be quite a problem to construct a fixture for a certain class of work, especially where nothing of its kind has ever been previously attempted. When laying out fundamental outlines of a certain fixture, one often stumbles across something accidentally, which, when worked out, proves exactly what is wanted. In the model shown by Fig. 1 a circular cut below the centre was attempted by different toolmakers without success. They first milled down as far as possible with a T cutter, and tried to wiggle it out with a hand tool. That worked all right, but was a very expensive method. The writer happened to be around while this operation was being performed, and, after some few inquiries, suggested the design shown in Fig. 2.

As only 10,000 of these blocks were to be manufactured, the expense of the tool had to be considered, and, therefore, it was decided to place the fixture in a universal milling machine until such time as the blocks, Fig. 1, would be in more demand to warrant a more elaborate equipment.

Detail of Fixture.

A machinery steel block (A), shown in Fig. 2, was machined all over, and a $\frac{1}{4}$-inch hole bored to one side of its centre. The top was surfaced off in the same setting. The bottom of the hole was counterbored to a turning fit for a $\frac{3}{8}$-inch thick washer (B), and on top is located a tool steel vise plate (C), which is made a good turning fit in the hole of the block. A shoulder screw (D) tightens up firmly between the washer and the bottom of the vise plate. A drill rod handle (E) was driven in on one side of vise plate, with a stop (F) and stop pins (G) on the other end.

On top of the plate is located the vise (H), which is solid with the plate, and is locked with two screws (I). A stop pin hole (J) was drilled part way into the plate. This locates the work in position. On account of the model block being made in different heights an adjusting block, (K) is placed between the work and the stop screws (I). When the work enters, the pin (J) is so adjusted that the face of the work just bears against the wall, and does not wiggle to one side or the other before being clamped. The adjusting block is held stationary with a cap screw (L). A swinging clamp (M) is placed on top of the work, and is held with a knurled screw (N). When unloosening the work, it swings against the stop pin (0).

The fixture is placed on a cast iron plate (P) planed parallel and held securely with two straps (Q) and bolts. The whole attachment is located on the centre line of the work on a universal milling machine with two machine screws (R) in the T grooves of the milling table. A broaching cutter (S) is placed in a milling machine collet and located parallel with table. This cutter is made the same width as the previous T cut, and the cutting edge on both sides is a little concaved, thereby making it free cutting. After being properly adjusted for height and centre, the spindle of the milling machine is locked with a wooden wedge between the bottom of the cone pulley, and the body of machine to prevent the cutter from turning around. Stops are set on each side of the milling table.

To operate the fixture, place the work on the locating pin, turn strap over the work and run down the knurled screw which holds it firmly. Turn handle (E) to stop pins on each side and at same time feed in to the required depth. This attachment can be made to mani-

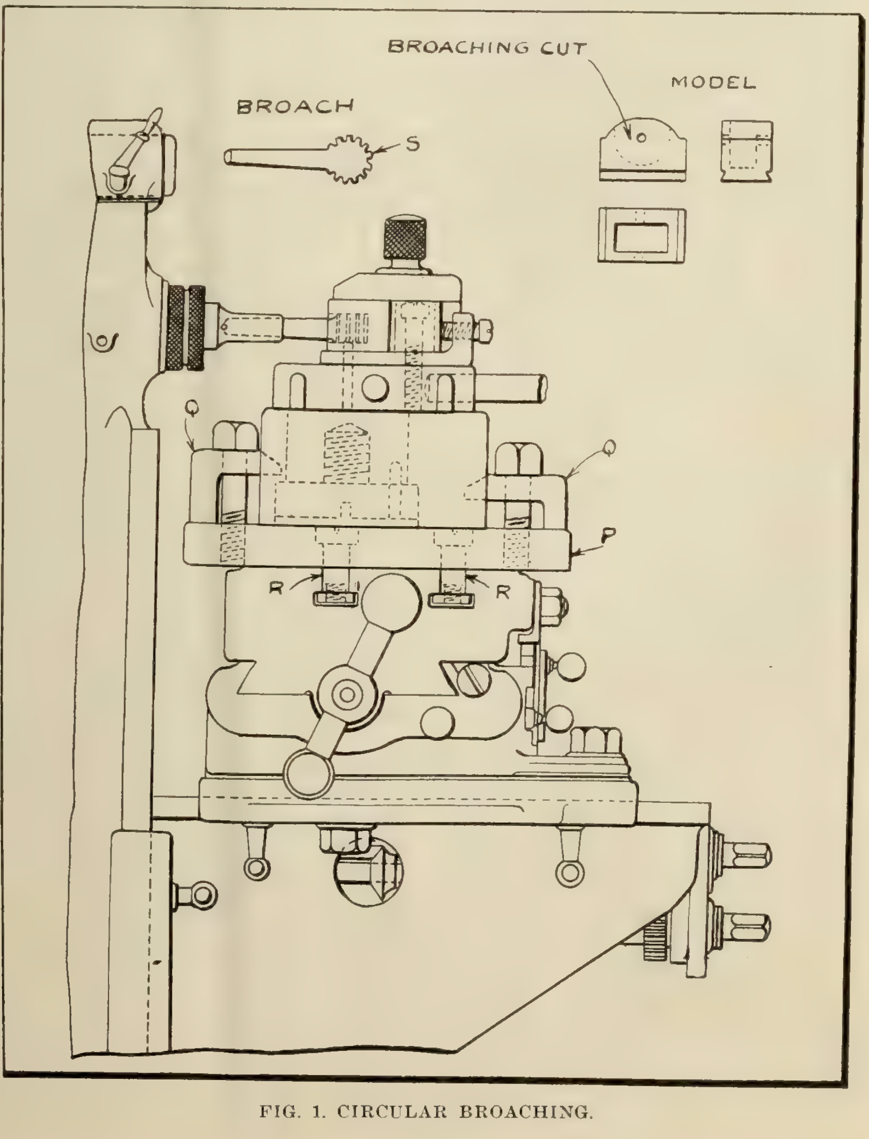

FIG. 1. CIRCULAR BROACHING.

pulate the work a great deal faster by placing a cam motion on the handle (E), thereby operating the whole fixture automatically.

BABBITTING EXPERIENCE.

. By Jas. E. McCormack.

LAST season I had a couple of solid bearings to re-babbitt, and had no cores of the proper size at hand. I had once seen the same shaft lined-up in position bare, and babbitted as it was; then a couple of hours were spent pounding the bearings off, and removing with a half round file enough of the metal to allow the shaft to revolve freely.

Detail of Method Adopted.

I decided to try some other method, and after unbolting the bearings, I blocked the shaft up, slid the bearings off, and, of course, removed all the old babbitt. I then cut a strip of paper a little wider than the bearings were long, and put two laps of this around the shaft at each bearing; cementing the edges down tight, and turning the shaft to put these cemented edges underneath, so that the flowing metal would not loosen up the joint and spoil the run. To make doubly sure that the paper would keep its place, I wrapped it with small cord. Starting just inside one edge of the bearing surface with the centre of the string, I made one straight lap around the shaft, then wound spirally to near the other edge of the bearing by lapping with both ends simultaneously, finishing with one straight lap and tying the ends together. When this was done, I had made about one lap with each hand for every inch the bearing was long.

In addition to holding the paper in place, this formed oil grooves in the metal to assist in lubrication, care being taken that the cord used was not so coarse as to make the grooves deep enough to materially weaken the lining, and also that the grooves did not extend to the outside edge of the bearing, and thus afford a spillway for the lubricant to waste

After the pouring was finished, a lever passed through the spokes of the pulley forced the shaft to turn, and after the second revolution made in this manner, the holding bolts were removed, and the bearings pulled off by hand. The paper and as much cord as would come were taken out, and the bearings replaced. The latter have given entire satisfaction and the work was accomplished in much less time and with less labor than would have been required to loosen them with a sledge and ease them with a file if the paper had not been used. When oil is the lubricant applied, a finer cord should be used than if the lubricant is to be cup grease.

Another Example.

In another machine there was a bearing which had given trouble from the first day it was operated, this trouble being caused by the designer attempting to make two bearings do the duty of three. There should have been a pedestal alongside of the machine, with a third bearing to carry part of the strain of the belt, but the arbor was made too short to allow of this, thereby throwing upon this troublesome bearing an excessive pressure and friction.

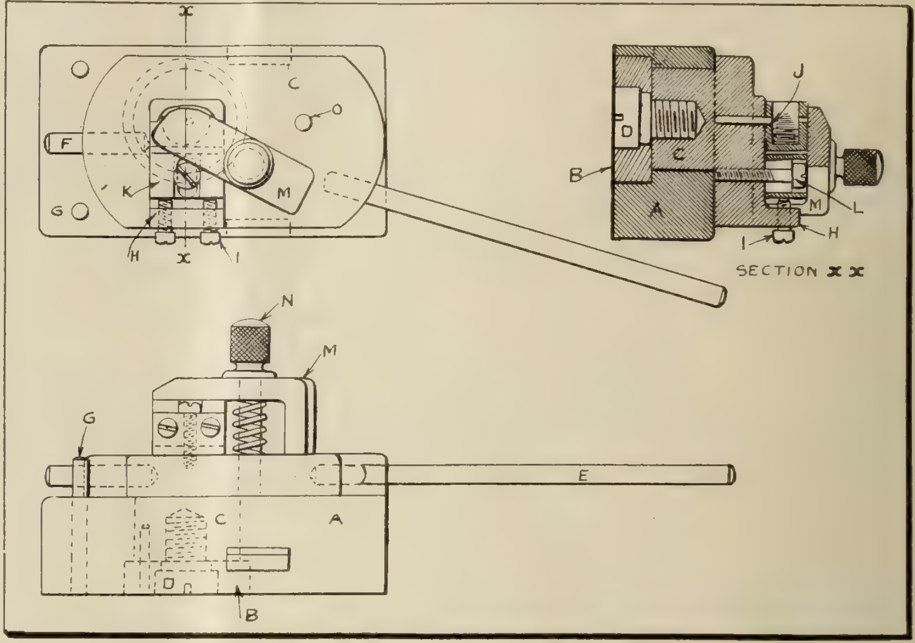

FIG. 2. CIRCULAR BROACHING.

The arbor was 2 7-16 in. diameter, and ran 1,800 revolutions per minute in bearings six inches long. I finally secured a cool running bearing as follows: I began by digging out all the babbitt, and chiselling in the bottom of the bearing a chamber about ⅞ in. wide, ⅝ in. deep, 3½ in. long on the bottom and 5 inches long at the top, the ends sloping up gradually to a point. I next cut a stick to fit this chamber and come even with the top of the iron, but afterwards whittled it on the two sides to bring it to ½ in. wide instead of ⅞ in., and with a cord I bound this to the under side of the arbor and directly over the chamber, having first carefully wrapped the arbor with two thicknesses of paper and cemented the edges down.

With pieces of old babbitt I blocked the arbor in position, puttied and poured the bottom half of the bearing, then bolted the cap in place with liners inserted, and puttied and poured it also. When cool I removed the cap, raised the arbor, took out the cord, stick, and paper, smoothed up the reservoir (where the stick had been), eased off the edges of the bearing, bored out the grease cup hole, cleaned the parts, filled the reservoir with cup grease, and re-assembled the parts. I next filled the grease cup, and, after forcing some of the grease through onto the arbor, I started the machine. The bearing did not heat, and it has not given any trouble since, nor has it required any more than one-third the amount of lubricant that was formerly necessary.

As the reservoir itself was seamless, and as the arbor had been blocked in position with pieces of babbitt, and the new pouring had flowed around this perfectly, there was no chance for lubricant to waste by oozing through the babbitt, and out between it and the frame of the machine. The grooves left in the metal by the string formed passage ways for the lubricant to reach every part of the journal.

A little resin in the babbitt causes it to flow better, and is good to use when doing babbitting in an unheated building in winter weather. Asbestos mixed with cylinder oil makes an excellent substitute for putty when babbitting, and it has the advantage that it will keep for months, ready for use, and does not get hot like putty.

MOTOR BREAKDOWN.

By A. F. Adams.

ON Tuesday, June 24, of this year, during a severe electrical storm, which passed over the city of Vancouver, the 400 h.p. 3-phase alternating current, induction motor, in the plant of the Vancouver Ice and Cold Storage Co., which drives a 130-ton ammonia compressor, stopped after a particularly heavy peal of thunder.

When the machine stopped, the no-voltage circuit breaker went out, at the same time throwing oil out of the circuit breaker box. Smoke also was noticed around the motor, but apparently it came from the breaker box. On investigation, the fuses and all parts of the motor seemed to be uninjured, and as soon as the city turned power on the line from which we were feeding, it having been temporarily shut off, the motor was started and ran for 26 hours, showing no signs of trouble.

Development of Trouble.

We had to shut down for a couple of days while the compressor rod was being turned and the valves were being overhauled. This work being completed, the compressor was again started, but had hardly attained full speed when the insulator on the armature coils of the motor gave way in a number of places.

The rotor was left in its natural position, being held by the end bearing, while the centre bearing was slung up. The armature, including the frame, was moved straight out from the rotor on to a platform built for the purpose, after which men were at once put to work to repair the broken insulation.

Trouble Again in Evidence.

On July 3, the motor was again started up, when the insulation gave way at several more places. These having been repaired, the motor gave no further trouble. The motor is of 400 h.p., 2,200 volts, 117 amperes per terminal, 3-phase, 60 cycles, 285 r.p.m., full load speed, and was built by the Canadian Westinghouse Co., Hamilton, Ont.

Query I.

Did the lightning puncture the insulation? If so, why did the motor not show signs of trouble when it was first started after the storm?

Query II.

If lightning was the cause of the trouble, is there not some way of protecting the motor and making it safe to operate during an electrical storm?

The motor, which is loaded only to about half its rated capacity, has been in operation two years, and has never previously given a minute's trouble.

G.T.R. "SAFETY FIRST" MOVEMENT.

THE Grand Trunk Railway, adhering to the progressive policy which characterizes that system, announces the inauguration of "A Safety First" movement. Mr. Howard C. Kelley, vice-president, has issued an official circular calling the attention of the officers and employees to the "great importance of an organization for the prevention of injuries and damage to property."

Mr. George Bradshaw has been engaged as safety engineer, charged with the duty of putting the movement into effect. He will inspect the lines, terminals and shops, and confer with the various officers on matters pertaining to the safety of the travelling public and employees.

"Safety" Meetings.

The thoroughness with which the Grand Trunk is going about this important work is shown by the fact that the safety engineer, assisted by the local officers, will hold "Safety Meetings" at all important centres on the system, at which practical instruction bearing on safety will be given to employees in all departments.

Stereopticon views of unsafe and safe conditions and practices will be shown and explained, the purpose being to reach and make a lasting impression upon the mind of every employee for the benefit of safety. Committees composed of officers and employees will be organized on all divisions, terminals and in all important shops whose duties it will be to discover and correct unsafe conditions and practices.

The management of the Grand Trunk has kept in close touch with results obtained on other important systems in the United States, and having concluded, after careful consideration, that the movement has great merit, will push along its application with the greatest vigor.

"It is our purpose," remarked Vice-President Kelley a few days ago, "to extend this highly important work to every branch of the service. Safety is the first and most important consideration in railroad operation, and no effort will be spared to give to every patron and employee of this system the greatest possible protection."

* * *

North Battleford, Sask.—Recent figures from North Battleford place the assessment for 1913 at $10,034,137 as compared with $5,579,397 for 1912, giving an increase of $4,454,740, or nearly 99 per cent. It is said that within two years, at least, the city will finally have adopted the single tax system. The assessment for the present year is 100 per cent. on the land and 30 per cent. on buildings. Fully 30 per cent. of the land within the city limits is assessed on the acreage basis. The city is negotiating with the Hudson's Bay Co. for the purchase of 375 acres of land close to the present improved portion of the city, the intention being to create a park. A subway, costing $50,000, is at present being constructed across the C.N.R.

THE MECHANIC LOOKING FOR A POSITION.

By J. E. N.

HOW many mechanics have applied for a position at some plant where there was a vacancy on the staff, and for no reason they could figure out, the application would be turned down. Perhaps they had good records, and No. 1 recommendations, but it was no go. There are several things a mechanic should attend to if he desires to secure a favorable hearing, and a few hints to some of the boys may be helpful.

Serviceable Hints.

I remember reading what a prominent business man said about this matter. Said he: "If I only had a few dollars I would spend them on a neat outfit of clothes (unless I already had them) and get a clean shave, a hair cut and a general brush up before applying for a situation, for it is a mistake to imagine that any careful business man will employ a slouchy applicant." Most employers will carefully overlook a prospective employee, examine his clothes, speech and manner. If you hesitate in your answers to his questions, he will probably conclude you are without confidence in your own ability; therefore, show by appearance and manner that you have some pride, intelligence and confidence in yourself, but be careful not to be too independent as to become impertinent.

Do not ask the prospective employer's pardon for intruding upon his valuable time, or even for being so thoughtless as to be on the earth, but be courteous and straightforward without being servile.

It is a good idea to go looking for the position with the determination of making the employer certain that he needs you. Tell him that you want the opportunity to show him that you can save him money, and if you cannot do so you will cheerfully get out. It is well to remember that no one wishes to employ a failure, so do not be listless, dopey or despondent in your manner, no matter how you feel, but brace up, put on a cheerful face, and ask for the position like a man. If you are too late, ask him if he knows where a good man can get a place, and the chances are that he will put himself to some trouble to help you out if you impress him right.

Do not keep your overalls on when you go applying for a situation, thereby expecting to impress folks with the idea that you are a worker, because probably the man you wish to impress will put you down in his mind as being too lazy to clean yourself properly.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

DOUBLE SPINDLE, DIRECT CONNECTED MOTOR DRIVEN GRINDER.

THE illustration shows a Double Spindle Direct-Connected Motor Driven Disc Grinder, carrying 18 in. diameter disc wheels, which has just been developed by Charles H. Besly & Co., Chicago. It brings two grinding discs in contact with the work, grinding two parallel surfaces simultaneously, and is largely used by wrench manufacturers, brass nut manufacturers, etc.

The motors are the new pressed steel type recently developed by the Westinghouse Electric & Manufacturing Co., and which were recently described in these columns. The motors are bolted on sub-plates which are mounted on ways planed on main bed casting, and clamped in position, similar to the headstock and tailstock of a lathe. The head to the left is stationary, but the one to the right can be moved along the bed by means of gear and rack, and clamped to grind any desired length within the capacity of the machine. The motors are 5 h.p., 1,400 r.p.m., to operate on 25 cycle alternating current, and when built to operate on 60 cycle current, the machine is equipped with 20 in. diameter disc wheels, running 1,200 r.p.m. in order to get the proper abrasive speed. These machines are not built to operate on direct current circuits.

To bring the discs in contact with the work, the rotor shaft or spindle of the right hand motor has an endwise movement of one inch. This movement is actuated by lever and pinion engaging a rack cut on the outer bearing bushing. The rotor of this motor is displaced ½ in. from magnetic balance, while grinding. Careful tests show that this displacement reduces motor efficiency only 1 to 2 per cent., while maximum output remains approximately the same as when running in magnetic balance. Longitudinal movement of this sliding spindle is limited inwardly by adjustable micrometer stop screw, graduated to read to .001 in., so that work may be ground accurately to size and duplicated. The work rest, which has vertical adjustment, is supported from the slotted pad on front of bed casting, and the machine regularly has ten work rests in assorted widths from ¼ in. to 5 15-16 in.

The machine is equipped with automatically telescoping dust hood, hinged at back to give free access for changing discs, and has air tight connection at back of machine for exhausting the grindings. Provision is made so that a third wheel and rockershaft may be attached to the left end of the machine at any time. On this shaft may be mounted a suitable work table to serve this third grinding disc.

It will be noted that the motor rotors are built up directly on the grinder spindles, these spindles being of hard crucible machinery steel, and run in inserted bearing bushings of phosphor bronze.

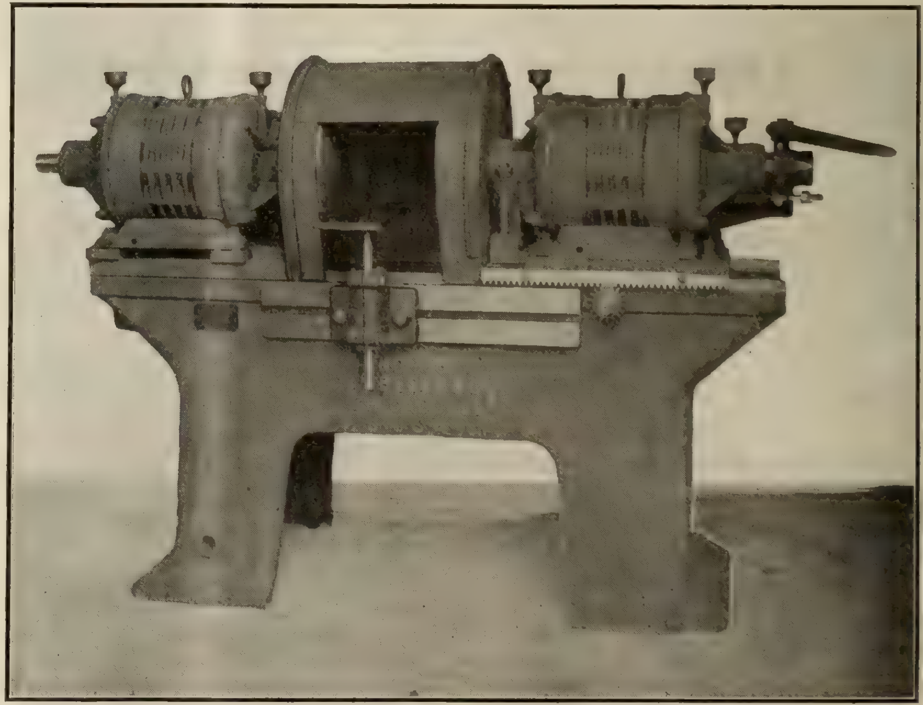
The motors are equipped with special end castings to receive the inserted bearing bushings, and end thrust of spindles is taken on hardened and ground tool steel thrust collars. The end play of spindle is controlled on outer bearing bushing by adjustable keyed collar held in place by lock nut at end of spindle.

In the right hand motor, both bearing bushings slide with the spindle and completely incase it; therefore, the spindle is well reinforced when under load, and thoroughly protected from emery dust. The spindle and thrust bearings are lubricated by solid oil from compression oil cups, oil grooves being so placed that oil is positively forced where it is needed. Movement of the solid oil is always outward, which prevents grit entering and cutting the bearings.

The geared lever feed on sliding spindle gives the operator a leverage of 20 to 1, so that he may force the machine to the limit of its driving power without undue muscular exertion. The lever is clamped to the pinion stud. This is a feature, because the lever may be clamped on this stud in just the position which makes it the handiest for the workman.

The spindles are 2 in. diameter in bearings; the height of machine to centre of spindles is 40 inches; the combined length of four bearing bushings is 31 11-16 inches; the maximum opening between disc wheels is 10 inches; the floor space of bed casting is 24 inches by 58 inches; the bed of machine under heads is 14 inches by 64 inches, and the shipping weight, 2,600 lbs.

It is very desirable that this type of disc grinder be direct connected motor driven for the reason that when belt driven it requires a very large and heavy countershaft, it being necessary to provide in the countershaft a drum pulley long enough to accommodate the full sliding adjustment in the movable head of the grinder. The countershaft regularly furnished with this size grinder when belt driven is 96 inches long, and weighs over 700 lbs. By using the mot-



DOUBLE SPINDLE DIRECT CONNECTED MOTOR DRIVEN GRINDER.

or driven machine, all this overhead work is naturally omitted.

POWERFUL HYDRAULIC FORMING PRESS.

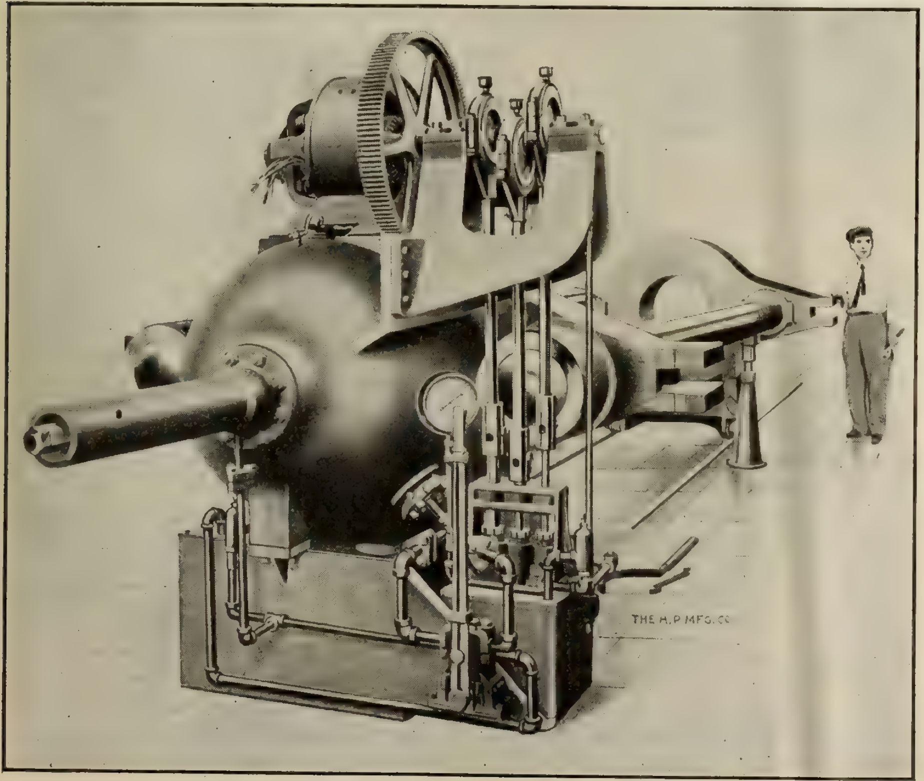
THIS powerful machine is used for general machine shop work, but was primarily designed for forcing shafts into sugar rolls for large sugar mills, being largely used for that purpose.

The press is built of selected material, the principal parts being of forged steel and open hearth steel castings. The main pressure ram works through a long and close bearing packed with a U leather packing held in place by a steel gland. The ram is returned by an auxiliary ram working through the end of the main cylinder. A direct pull is thus obtained. All parts are accessible for repacking. The press head is mounted on wheels so that the daylight or working space may be easily changed by moving the head on the rods. Strain rod spacing blocks are placed in the rods between the press head and the heads of the rods for short work. Adjustable strain rod supports are furnished for supporting the rods while changing the daylight space.

The largest diameter which can be handled between the strain rods of the 1000-ton press is 48 inches. Many shops require about 300 tons pressure for special work of such shape or size that it cannot be handled unless a greater space is provided between the rods. For this purpose, the main rods can be removed, and forged bars placed in the outer slots of both the cylinder lugs and head, and keyed in place. The press will then accommodate 84 inches between the bars.

The pump is of the triplex, direct connected, motor driven pattern mounted on the press. The pump chambers are cast en bloc of government bronze. A special type of pump control is used, which enables the operator to knock out any number of the pumps at will. The control will automatically knock out at fixed pressures without attention from the operator. The main operating valve is of the quick change, double acting type with quadrant for holding it in forward, reverse or neutral positions.

The Hydraulic Press Mfg. Co., Mount Gilead, Ohio, are builders of the press here described and illustrated.



POWERFUL HYDRAULIC FORMING PRESS.

STEEL: OVERHEATING AND BURNING.

IN a paper read at the North-East Coast Institution of Engineers and Shipbuilders, J. E. Stead, D.Sc., says:—

Overheated steel is material which has been heated to a point short of incipient fusion, and which when cold, in consequence of such treatment, has a coarse crystalline structure and is liable to break down under shock. Burnt steel is material which has been heated to a point above incipient fusion. Overheating of structural and soft steels does no permanent harm to the material, and burning is not accompanied by intercrystalline oxidation unless fissures are formed by straining the highly-heated steel. Burnt steel which has not been strained when hot, and is consequently free from fissures, if allowed to cool in air and then reheated to a proper temperature, can be worked without breaking to pieces, and, unless the material has initially been brought to a semi-liquid condition, will be equal in good properties to the same steel before burning, provided, of course, that the sulphur and phosphorus are not excessive.

Dr. Stansfield was the first to recognize that burning of steel was equivalent to partially bringing the steel back to the condition it was in when in the ingot. If the heating is carried on well above the incipient stage of fusion, liquation occurs, and a more fusible part actually liquates out of the metal, which is left in a porous state due to the presence not only of fissures but of gas bubbles. The walls of the cavities, however, are not tarnished or oxidised, and can be readily welded up after reheating and forging. To reproduce good steel from such material requires a considerable amount of work, and, even after such treatment, it cannot be so good as the original steel. The temperature occasionally applied to tool steel ingots previous to forging is, in a sense, overheating, but the subsequent forging eliminates the coarse crystalline structure produced.

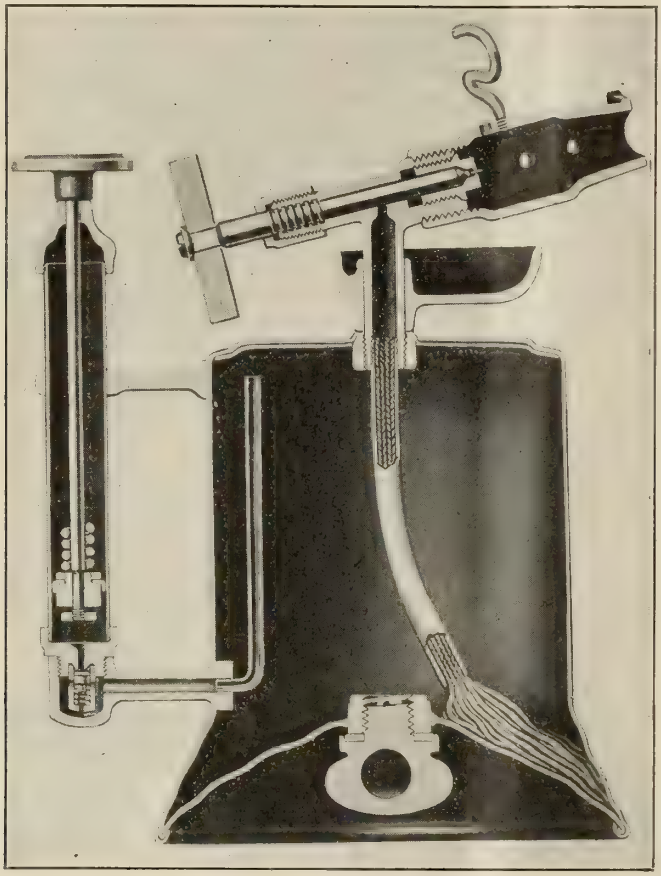
ELECTRICAL EQUIPMENT FOR RAILROADS.

THERE is no logical reason why a railway desiring to use electrical energy should have to begin at the beginning and build a costly special plant for its service any more than there is reason why, desiring coal, it should go to great trouble and expense of acquiring and developing coal mines. It can buy electrical energy in one case and coal in the other in many instances cheaper than it can possibly generate or raise coal from a mine.

The great technical difficulty for a station supplying energy to a large railway system is that the load factor is likely to be peculiarly bad. The railway load, with its sudden peaks and low average, can be handled much more economically in a station already carrying a huge miscellaneous output in which the relatively minor variations of the railway service sink and disappear. The gain in the matter of load factor in a station operating both railway and miscellaneous load is enough in most cases to determine the economies of the question.

A UNIVERSAL BLOW TORCH.

A new gasoline blow torch has recently been placed on the market by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., which embodies a number of novel features and improvements. These improvements, it is claimed, adapt the torch for all conditions of service, and it is therefore called a Universal Blow Torch. Illustration of the torch as a cross sectional view are here shown.



UNIVERSAL BLOW TORCH.

The burner is made particularly heavy so that it will retain its heat and keep the torch burning in cold or windy weather, and the drip cup is made especially deep so that it will start the torch under bad weather conditions. These features, however, do not detract from the use of the torch for indoor work.

Another feature of the torch is the self-cleaning burner valve. The needle at the end of the valve stem cleans the hole automatically when the valve handle is turned. The valve seat need, therefore, never be injured by picking at the opening to clean it. The valve seat is a separate replaceable plug.

The handle of the valve is of fibre, and does not get hot, nor does it need a long valve stem for cooling as does an iron handle. On the other hand, it will not crack, loosen and come off as will a wooden handle. It does not char or burn.

The tank it is claimed, is of the heaviest gauge brass ever used for torch tanks, and is reinforced with an extra corrugated brass disc covering the entire inner surface of the tank pot. This insures the tank keeping its shape under very rough handling. The pump valve works in a cylindrical guide which assures perfect seating of the valve. It can be taken apart and any part replaced separately.

The illustration shows the quart size of torch. A pint size is also furnished and differs only in the shape and size of the tank.

◆

AUTOMATIC REPLACEMENT OF ELECTRIC LAMPS.

An improved device for the automatic replacement of electric lamps for signalling is, according to the Electrical Review and Western Electrician, now being given a trial by the Pennsylvania Railway Co. If successful, some thousands will be used. In this new device, a disc holding four lamps is pivoted within the lantern, one lamp burning in focus with the signal lens; the other three lamps being in reserve. When a burn-out occurs, the bad lamp is immediately thrown out of focus, and a good lamp substituted. This practically eliminates one of the greatest troubles now being experienced, that of maintaining a lighted electric signal regardless of lamp burn-outs.

◆

CANADA'S STEEL OUTPUT.

According to the report of the Bureau of Statistics of the American Iron and Steel Institute, 1912 was a record year in Canadian iron and steel production.

The production of all kinds of steel ingots and castings in Canada from 1908 to 1912, is given below by provinces:

	—Gross	Tons—		
Provinces.	**1912.**	**1911.**	**1910.**	**1908.**
Nova Scotia ..	416,313	398,781	371,196	326,311
Ontario	417,634	378,158	359,253	178,141
Que. & B.C...	19,084	13,932	11,475	5,595
Total	853,031	790,871	741,924	509,957

The following table gives the production of all kinds of steel ingots and castings in Canada by processes from 1904 to 1912:

	Bessemer.	**O.H.**	**Misc.**	**Total.**
1904	42,738	106,046	...	148,784
1905	164,488	238,681	280	403,449
1906	219,791	347,778	3,320	570,889
1907	202,268	440,936	3,550	646,754
1908	108,433	401,119	405	509,957
1909	182,304	496,142	305	678,751
1910	199,570	542,354	...	741,921
1911	189,797	601,074	...	790,871
1912	207,569	645,062	400	853,031

The output of all kinds of finished rolled iron and steel in Canada in 1912, with one plant estimated, was 861,224 tons, a record production, and an increase of 79,300 tons over 1911. The details of production for four years are as follows:

	1912.	**1911.**	**1910.**	**1909.**
Rails	423.885	360.547	366.465	344.830
Str. shapes and wire rods ...	64.082	76,617	80.993	74.136
Plates & sheets, nail plate, merchant bars, tie-plate, bars,etc..	373.257	344.760	292.353	243.775
Total	861.224	781.924	739,811	662,741

The production of all kinds of finished rolled iron and steel in Canada in the last five years is given below by provinces, in gross tons:

Provinces.	**1912.**	**1911.**	**1910.**	**1908.**
Nova Scotia ..	337.466	336.520	310.460	261.078
Quebec	88.172	65.378	62.605	54.971
Ontario	418.346	367.768	356.645	174.158
N.B., Alta., & Man.	17.240	12.258	10.101	6.315
Total	861.224	781.924	739.811	496.517

The following table gives the production of all kinds of finished rolled iron and steel in Canada from 1895 to 1912 in gross tons. Rolled forging blooms and rolled forging billets are included for 1905 and all subsequent years. Gross tons are used:

1912....	861.224	1906....	571.742	1900....	100.690
1911....	781.924	1905....	385.826	1899....	110.642
1910....	739.811	1904....	180.038	1898....	90.303
1909....	662.731	1903....	129.516	1897....	77.021
1908....	496.517	1902....	161.485	1896....	75.043
1907....	600.179	1901....	112.007	1895....	66.402

The output of forged iron and steel by mills was 22,415 tons. Last year the cut or wire nail output was 788,190 kegs as compared with 652,861 kegs in 1911. The production of finished angles, splice bars, tie plates and fish plates was 52,157 tons.

FOUNDRY PRACTICE AND EQUIPMENT

ARTIFICIAL LIGHTING OF IRON FOUNDRIES.

THE Annual Report of the Chief Inspector of Factories and Workshops in Great Britain, for 1912 contains a special report upon the "Artificial Lighting of Iron Foundries," by Mr. D. R. Wilson, compiled as the result of visits to forty foundries in different parts of the United Kingdom. Mr. Wilson expresses the opinion that so far as the actual carrying on of the work is concerned, the intensity of the illumination appears to be of little importance.

At the moment of pouring, ample light is derived from the molten metal itself, and the previous and subsequent processes can be and often are carried out with the aid of supplementary light obtained from portable lamps. Insufficient light is undesirable from the point of view of accidents, caused by stumbling during the passage from one part of the foundry to another, especially when handling metal, or when passing near moulding pits or parts of the foundry in which metal has been recently poured. In other words, "general" rather than "local" illumination seems to be the important matter to be considered.

General Characteristics.

From the point of view of lighting, an iron foundry possesses several characteristics which are either absent or less pronounced in other works:—

(1)—The whole of the floor space is covered with very dull and dark material. Measurements of the diffused reflecting power of this surface indicate that only about 2 to 3 per cent. of the incident light is reflected. This refers to iron foundries only, as in steel foundries a light colored sand is used, and the diffused reflecting power is about 10 per cent.

(2)—The material covering the floor is of uniform color, and there is almost complete lack of contrast throughout the room. There is, therefore, no surface to serve as a contrasting background for obstacles, which are often difficult to distinguish.

(3)—The processes involve the production of much dust, and at certain stages of the work dense smoke is evolved.

(4)—Shadows are said to be specially undesirable, probably on account of the further reduction of the illumination.

(5)—Glare is liable to result from the molten metal, and sometimes from badly shaded light sources placed too low, with the consequence that the eye is temporarily dazzled, and risk of stumbling is increased.

High Degree Illumination Necessary.

From the foregoing remarks, it will be seen that for efficient lighting the illumination in iron foundries should be high compared with other rooms. Objects of similar and very low diffused reflecting power are the more readily distinguishable, the more intense the illumination received by them, since contrast is enhanced by the increased difference in the amounts of light reflected. More efficient contrast could also be obtained, especially in small foundries, by frequent limewashing of the walls, the white surface of which would then serve as a background for the dark colored objects on the floor.

In addition to this advantage, a white wall does much to increase the actual illumination, especially with natural lighting. The walls in many foundries are already limewashed, but they are often almost black owing to the deposit of dust. The presence of smoke in any quantity greatly reduces the illumination on the floor, especially when the light sources are situated high up. This is, generally speaking, only a temporary matter, since the smoke soon makes its escape from the room, but it constitutes one more argument in favor of as intense an illumination as possible.

Dust, according to the report, has a more permanent deleterious effect in foundries where incandescent gas is the illuminant, since it is said to injure the mantles and to block the air orifices. On the other hand, it was found that incandescent gas systems are frequently adopted, and if suitable precautions are taken, such as protection of the mantles by glass shades, use of powerful units placed high, etc., this method of lighting appears to give complete satisfaction, and is very efficacious as regards illumination. Dust also quickly destroys the whiteness of the walls by settling on them. This can be obviated, at any rate to some extent, by brushing down at frequent intervals. The dazzling effect of the molten metal is of course unavoidable, and is more or less temporary. Glare from high intensity light sources has been noticed occasionally owing to their being placed too low.

Shadow is said to be specially undesirable, as tending to confuse the eye, and as reducing the illumination. In considering shadow, three points are of importance, namely, position, extent and depth. The position of a shadow is determined by the position of the responsible light source. The latter should of course be placed in the locality in which the shadow is undesirable. The extent of the shadow depends on the height of the light source; the greater the height the shorter the shadow. The depth depends on the presence or absence of neighboring light sources, or, in other words, on the evenness or unevenness of the illumination.

For this reason, for the lighting of a given area, it is preferable to have two sources of, say, 1,000 candle power each, rather than a single source of 2,000 candle power. It would appear that the most satisfactory method of lighting is by means of powerful units, fixed as high as possible above the floor, and spaced comparatively close together. Tables given in the report show that this method is adopted in most of the foundries classified as well lighted.

Results of Observations.

The results of observations show that a sharp distinction may be drawn between well and badly-lighted foundries. In some of the former, the very high minimum value of 1.5 foot-candles is attained and even exceeded, and the lighting may be considered good if the illumination does not fall below 0.5 foot-candle. In the badly-lighted foundries, in almost all instances, the system of lighting consists of ordinary flat-flame burners. In addition to their feeble intensity, these have other disadvantages. They are of necessity placed low down, and, in contrast with their dark surroundings, tend to dazzle the eye; they are also liable to flicker unpleasantly, and to cause confusing shadows, and are uneconomical from the point of view of gas consumption. Only one foundry lighted in this way could be described as even moderately well lighted; the others vary from poor to very bad.

The actual data indicate the extremely bad lighting that exists in some of these foundries, measurements as low as one-sixtieth of a foot-candle being recorded.

Some idea of this deficiency may be given when it is remembered that the minimum illumination in a poorly-lighted suburban street is about 1-100th of a foot-candle. It is probably impossible to secure really efficient lighting with the old-fashioned gas jets, and these should be replaced by some modern high-intensity system under expert advice, whereby not only would the illumination be greatly increased, but a large saving in the amount of gas consumed would follow. The investigation appears to show that the illumination received on a horizontal plane one foot above the floor level in:—

Well lighted iron foundries does not fall below 0.5 foot-candle.

Fairly lighted iron foundries does not fall below 0.3-0.4 foot candle.

Moderately lighted iron foundries does not fall below 0.2-0.3 foot candle.

Poorly lighted iron foundries does not fall below 0.1-0.2 foot-candle.

Badly lighted iron foundries is below 0.1 foot-candle.

It would seem, therefore, that the lighting cannot be deemed to be adequate unless the illumination received on a horizontal plane one foot above the floor level is not less than one-third of a foot-candle over any part in which work is being carried on or over which any person is liable to pass.

DOMINION STEEL DIRECTORS' TOUR.

MR. WILLIAM McMASTER, vice-president of the Dominion Iron & Steel Corporation, accompanied by W. G. Ross, George Caverhill, and Mark Workman, directors, returned on Aug. 28 from a trip of inspection of their properties in Cape Breton and Newfoundland. While visiting the properties they were accompanied by J. H. Plummer, president; D. McDougall, general manager of the Dominion Coal Co.; C. S. Martin, general superintendent of the Dominion Iron & Steel Co., and M. Scott, superintendent of the steel department. The itinerary included not only the inspection of the works at Sydney, but also the colleries in the Waterford district and the limestone quarries at Wabana, Newfoundland and Marble Mountain, C.B.

Two days were spent at Sydney on the inspection of the Steel Works, and the directors expressed themselves satisfied with the improved condition of the plant since their last visit. All construction work has been completed, and the following are some of the additions and extensions that have been made:

Recent Equipment Additions.

Two blast furnaces, making eight in all, are working satisfactorily.

A new 500-ton mixer has been installed, which takes care of all the steel made in the steel furnaces.

A rolling mill has been erected for the manufacture of round, square and flat bar steel, also a new wire mill, for making plain wire, galvanised wire and barbed wire, together with the new wire nail works, and a new cooperage. The wire rod mill was not working, there being no duty on wire rods; as a consequence the company is not able to secure the Canadian trade.

In the steel works and subsidiary plants there are about 3,500 employes.

The Coal Mines.

A day was taken in visiting the coal mines. At the present time there are seventeen collieries in Cape Breton, two of which have been recently opened. The site of the Victoria seam was visited. Men were working at the time, opening up the shaft. The mines are all operating to their capacity. The directors had not time to visit the two collieries at Springhill, which make nineteen in all. Including these two mines, it is hoped that the output of coal this year will come near to 5,000,000 tons. The mines as a whole employ 10,000 to 11,000 men.

Iron Ore Properties.

The iron ore property at Wabana was visited, and some of the directors who have not had the opportunity of seeing it before were gratified at the area and large deposits of ore, and also the amount of work, both open and submarine, that had been done. About 1,200 men are employed at these mines. Here the Nova Scotian officials courteously gave the party the opportunity of going down their shaft, some 8,000 feet in length.

The limestone quarries at Port au Port and Marble Mountain are turning out large quantities of limestone. The former, which is in Newfoundland, has only been opened within a year, but the product is of a most satisfactory character. The latter is on the Bras d'Or Lakes. These quarries, together with the Georges River quarries, employ some 800 men.

A Work of Vital Importance.

Mr. McMaster, in speaking of the plant of the corporation, expressed the opinion that, considering how these allied industries enter into the life of the Lower Provinces, and of the whole Dominion of Canada, how indispensable they are in the products they offer, how many are dependent upon their continuance for employment, and how necessary they have become in the growth and development of the country—the Government might well afford to give this business a degree of countenance which would be commensurate with the importance of the interests involved.

Newfoundland.

The conditions in Newfoundland Mr. McMaster found excellent, although the catch of fish, on which the people mainly depend, had not been so large as in former years. The price is high. The Reid Company are doing big things, with the energy and foresight which have marked all their undertakings from the moment the family became interested in Newfoundland. The company are, as is well known, interested in the railway development and water transportation feature, having a large fleet of good steamers doing a coastwise and United States business. They are also interested in the lumber and pulp industries, which they carry on with great vigour, giving employment to large numbers of people and, indeed, sustaining the largest interests, it might be said, in the old Crown Colony.

CANADA AND FOREIGN MARKETS.

"GET out into the market of the world," was the advice which Mr. R. S. Gourlay, president of the Canadian Manufacturers' Association, imparted to his fellow manufacturers at the Exhibition directors' luncheon the other day.

Mr. Gourlay said that manufacturing and agriculture went hand in hand, and that Canada had largely grown in those two directions to the development of national life. During the ten years ending in 1910, there had been tremendous growth in Canadian manufacturing industries. Establishments had increased by 31 per cent., capital by 179 per cent., salaries to officials by 85 per cent., wages to employees by 120 per cent., and products by 142 per cent.

"In every direction," said Mr. Gourlay, "the development of industrial life has been active, and in excess of any other period in the history of Canada.

Foreign Trade.

"Our increase in foreign trade, of 74 per cent., however, is relatively small, compared with the home trade. The time has come; yes, it is the obligation of every manufacturer to give some definite thought and attention and definite purpose to spending money to develop a foreign trade."

Ontario was face to face with the development of other Provinces along industrial lines. When the West learned Ontario's lesson, and went into mixed farming, industrial establishments would grow up to compete with those in this Province, and it would be well to prepare for that time by developing a foreign trade.

Will Wake Up.

"In a few years the West will wake up to the need of intensified farming, and the establishment of industries. That is why it would be a sane policy to reach out for the markets of the world," he said. "We have also to face the development of the Orient and to meet that we must know the markets of the world.

FOUNDRY AND MACHINE EXHIBITION AT CHICAGO.

MOST gratifying prospects fall to be recorded for a great exhibition of foundry and general machinery equipment at Chicago, from October 10 to 17, in connection with the American Foundrymen's and Allied Association's Convention. Over 150 exhibitors have already been enrolled and practically every line of apparatus will be on show.

The Foundry & Machine Co. Executive are sparing no effort in the matter of publicity to secure the greatest attendance of buyers, superintendents, foremen and operators, yet gathered together at this annual function, and, as a consequence, mutually beneficial results are sure to be the ultimate reward. Some idea of the extent and diversity of the operating machinery equipment already booked for the big show, may be gathered from the fact that over 100 motors of varied horse power, and 4 air compressors of 1,600 cubic feet per minute total capacity, will be required.

In past years, Canadian Foundrymen have made little, if any attempt, to make their identity a feature, each travelling, more or less independently, and being generally unrecognizable, except, perhaps, for the fact that their name appeared in the official registration record. There is opportunity, we believe, for some combination on the part of the Canadian contingent. Travelling arrangements to and from the Convention and Exhibition City, whereby the bulk of the representatives would be together, and distinguishing badges which those who exhibit would not fail to take notice of, are two ideas that strike us as being worthy of putting into practical effect, and although the period for putting the suggestions into action is now somewhat limited, there is ample time yet to inaugurate a movement which will indicate in a more forceful way than hitherto, that Canadian foundrymen are progressive, and that, in the matter of foundry equipment, there is desire for the best and latest, and an ever widening scope for its instalation and operation.

◆

THE CANADIAN NATIONAL EXHIBITION.

THE Canadian National Exhibition of the year 1913 is now in full swing, and, it goes without saying, that this latest product of "Queen City" genius loses nothing by comparison with its predecessors. The trend of our big show is unmistakably developing, however, into a species of circusdom, in spite of the agricultural and manufacturing features.

In the multitude of improvements and additions to the permanent equipment of the Exhibition, no evidence is apparent that the management have made endeavor to encourage and foster the pursuit and development of the craft of mechanical engineering in the variety of its many-sided aspects. The same old Machinery Hall is again packed with people and exhibits, for the most part so tightly, that it gives one the idea that a ship's stevedore had seen to the loading. The steps at the western entrance would almost make one feel that a somewhat studied indifference is manifested as to the propriety of a machinery building forming a part of the show at all. The management evidently do not realize that mechanical engineering in its myriad branches has done more for the uplift of the race generally, than any other art, craft, science or profession, and that the progress and development of this Dominion owes its present day high degree achievement and future outlook to the skill and capacity of engineers exemplified in their machine product.

Exhibitors in the Machinery Hall are full well aware that the conditions for display of their equipment are not such as to lend attractiveness to their exhibits, being rather the opposite in effect, and we are not a little surprised that the excellent material located for display should, as a consequence be so readily forthcoming. The advertisement due to apparatus being placed in the Canadian National Exhibition Machinery Hall, is and will be valueless as an auxiliary to a firm's own show room display until some definite steps are taken which will materialize into a Machinery Hall, at once an honor and credit to its title and purpose, and a recognition and tribute to what Canada and the civilized world owes to mechancal engineering industrial enterprise.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, August 30, 1913.—General business conditions have shown a slight improvement during the week, the prevailing optimism being reflected in the improved state of the building trade and the real estate business. Machinery brokers report business as still rather quiet, though one or two fair enquiries have been received. Eastern collections are fair, but from the West money still comes in slowly. A better tone is reported in finished lines of steel, consumers buying more heavily of miscellaneous products with the conviction that prices on the principal lines have about reached the lowest point. The pig iron market has been dull, with little movement. Prices remain unchanged.

The copper market is of considerable interest just now. Prices remain firm in view of the steady demand, and it is probable that before the end of the year there will be a marked advance in this metal.

Toronto, Ont., Sept. 2.—Business in machine tools was stimulated this week by the presence at the National Exhibition of several prominent manufacturers and agents with extensive exhibits. The Abitibi Pulp and Paper Co., Ltd., who have built an immense plant at Iroquois Falls, in Northern Ontario, are about to award the contract for their machine tool equipment, which will amount to about $15,000 worth.

Pipe Iron, Etc.

Nothing can be said regarding the pig iron market in Canada. Practically none is being manufactured, and quotations are not yet being made on English product. Business in warehouse steel plates, tubes, etc., is good, but practically no finished iron or steel is being imported. Manufacturers are not buying, and appear still to be waiting for prices to go down.

Metals.

The metal market was slightly firmer this morning, but not much business was being done. The copper market was slightly better. Tin was a little harder. Business in metals is quieter now than it has been since last October. It cannot be said that this is customary at this time of the year. It is merely the result of fluctuation in prices.

St. John, N.B., August 30, 1913.—One of the most prominent manufacturers in St. John, Major John James Gordon, died this week at his home in Coldbrook, following an illness of but a few weeks. He was about 60 years of age, and had been connected with many industries.

Charles Bradley, who conducted a boilermaking establishment in North St. John, died this week. He had been ill for some time.

There is a possibility that the town of Sackville, N.B., may take over the Sackville Electric light plant at a cost of $60,000. By securing the plant the town would be in a good position to offer industrial inducements in the way of special power rates, thus adding materially to the factories there.

There are now on their way to St. John, from Birmingham, Alta., eighteen cars of machinery, weighing approximately 792,000 pounds, made for the Atlantic Sugar Refineries, Ltd., by the Payne Joubert Machine and Foundry Co., which specialize in sugar machinery. C. Fricks, their representative, who is now in the city, will superintend the unloading.

Rhodes, Curry & Co., Ltd., of Amherst, N.S., have been awarded the contract for the new armory at Sussex, N.B., to be erected by the Militia Department. A call for tenders will be issued soon.

Operations commenced this week in the new plant of the Oil Motor and Manufacturing Co., Ltd., on Marsh Road, this city, in the machinery repair business, manufacture of elevators, etc., formerly conducted in Waterloo Street by Messrs. Myers.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Hamilton, Ont.—The Dominion Steel Castings Co., are now occupying their recently completed office building, and the extensions to the plant are going forward rapidly.

Amherst, N.S.—The Board of Directors of the Nova Scotia Carriage & Motor Car Co., Ltd., have authorised the completion of the new plant, and the removal of all operations from Kentville to Amherst.

Guelph, Ont.—A new company known as the Guelph Brass Foundry Co. will take over the plant formerly occupied by the Dominion Axle Works Co. The company will manufacture all kinds of brass castings.

Exeter, Ont.—Reeve Heeman, Councillor Doyle and Mr. Geo. Connor went to Fredericton, Ohio, last week, to inspect a foundry. The company is willing to build a branch foundry in Exeter if suitable terms can be arranged.

Hamilton, Ont. — The factory, machinery and stock of the Hamilton Lock and Hardware Manufacturing Co., Ltd., will be sold here on Friday, September 9, by C. S. Scott, liquidator. The machinery is valued at $36,601.

London, Ont.—A fire on August 29th destroyed part of the Western Fair buildings, including machinery hall, transportation building, etc., the loss being $100,000. The G. T. R. car works across the street had a narrow escape.

Toronto, Ont.—Tate Electrics, Ltd., manufacturers of high-class electric automobiles, have leased the new building at number 165 Church Street for a term of years, and will take possession in a few days. The premises consist of modern showrooms and garage. The lease was negotiated by Messrs. R. B. Rice & Son.

Hamilton, Ont.—The Canada Steel Co., Ltd., whose rod mill and machine shop were burned this month, announce that contract has been let for the complete rebuilding of their plant, and for a reinforced concrete machine shop. Temporary work is being rushed ahead, and the plant should be running again by this week.

Toronto, Ont.—Plans submitted by the Canadian Rogers Co., Limited, for the construction of their new factory, have been approved by the city architect's department. The proposed building is to be erected at 570 West King Street, and is to be used for the manufacture of silverware. The structure will be of brick construction, three storeys and basement, and will cost $25,000.

Windsor, Ont.—The Burroughs Adding Machine Co., of Detroit, will establish a branch plant and sales office in Windsor. W. J. Healey, formerly of Toronto, has been appointed branch manager. All the Canadian business will be handled from Windsor, where an assembling plant will be established and eventually the machines for the Canadian trade will be manufactured here.

Orillia, Ont.—The rumoured reorganisation of the Tudhope Motor Co., Ltd., has resulted in the sale of the whole plant and machinery to the Fisher Motor Co., of Walkerville. The new concern takes possession at once, and will operate the factory here during the fall and winter, at least until the stock and material on hand are made up. The factory has been practically shut down for three months.

Sault Ste. Marie, Ont. — Damage amounting to several thousand dollars was done to the power plant of the Lake Superior Corporation on August 26th, when lightning struck the switchboard at the power plant. Fire broke out, and only by great effort was the steel plant saved from destruction. The water did considerable damage to electrical machinery, and about 1,500 men were thrown out temporarily.

Sydney, N.S.—It has been decided at once to reopen the old Scott pit of the Inter-Colonial Coal Company. A new surface plant will be immediately installed to operate this pit. It is estimated that at the outset the output will reach 1,000 tons a day. No. 4 pit is to be opened, developed and operated to its fullest capacity. New levels are to be driven in under the coal, and the output from this pit will be materially increased. This programme of the directorate of the Inter-Colonial Company will mean an increase in the number of labourers from 900 to 1,500, and a corresponding increase in the population of Westville.

Sydney, N.S.—The special agent of the British manufacturers has recommended the building of a steel ship plant and traction engine works at Sydney, Nova Scotia. The shipbuilding scheme involves an expenditure of about 1,000,000, and provides a plant capable of building steel ships of any size up to 7,000 tons for the freight and coasting service. The smaller craft will include tugs, tenders and other ships of such size and class. The products of the traction engine works will include all classes and types. In connection with the shipbuilding plant and the traction works it is pointed out that Sydney is exceptional in its advantages for this class of industry. Rail and water connection, steel producing mills, and the close proximity of coal make it a very desirable location for any iron or steel manufacturing concern.

Electrical

Estevan, Sask.—The council is considering extensive additions to the light and power plant.

Wadena, Sask.—The council will spend $16,000 for the erection and equipping of an electric light and power plant.

Wardner, B.C.—The electric power house of the Crows' Nest Pass Lumber Company at Wardner was recently destroyed by fire.

Souris, Man.—A by-law will be submitted on September 2nd authorizing the expenditure of $40,000 on an electric light and power plant.

Brantford, Ont.—The foundation for the new hydro-electric sub-station was started last Wednesday. The building is to be rushed to completion.

Swastika, Ont.—Work is proceeding in the new power plant and mill of the Huronia mines in Gauthier township. It should be finished inside of two months.

Wolseley, Sask.—A by-law was subed to the city of Windsor in the early spring if the present plans of the Hydro-Electric Power Commission materialize.

Wolseley, Sask.—A by-law was submitted on August 20 authorizing the town council to purchase the plant of the Central Light and Power Company, Wolseley, Sask.

Englehart, Ont.—The Power Company have purchased part of the Dowzer lot on Fourth Ave., and will erect a large structure of re-inforced concrete to be utilized as offices and store.

Wallaceburg, Ont.—The Wallaceburg Gas Company are installing a new 250 k.v.a. generator. This will be operated by a 150 h.p. gas engine on one side and the present steam engine unit on the other side.

Neepawa, Man.—The town of Neepawa will call for tenders in the near future for apparatus, consisting of two 150 horse-power boilers and a generator unit of 125 k.w. capacity, direct connected to a suitable engine.

Toronto, Ont.—The latest estimate of the cost of the present Hydro programme in Western Ontario, including enlarged stations and other equipment, and the Windsor-St. Thomas extension, is in the neighborhood of $2,000,000.

Stanley Lightfoot has taken over the Toronto business of Lloyd, Blackmore and Co., patent solicitors. The business will be conducted by Mr. Lightfoot under his own name. The same office will be maintained in the Lumsden Building.

Montreal, Que.—The Siemens Company of Canada have been awarded the contract to supply 41 motors, ranging in capacity from 185 h.p. down, for the Acadia Sugar Refinery Company of Nova Scotia, in connection with their new plant.

Battleford, Sask.—The municipal electric light management will erect within the next three months two 250 h.p. engines and two 250 h.p. boilers, with Westinghouse generators and switchboard, to increase the output of the present plant.

Elora, Ont.—Hon. Adam Beck addressed a meeting here last week in favor of Hydro-Electric power for this village, and for Fergus. He stated that power could be secured at $33.17 at Elora. He said $10,000 would be required for installing equipment.

Toronto, Ont.—The Hydro-Electric Commission last week asked the Board of Control what they intended to do in the matter of taking wiring inspection out of the hands of the Underwriters' Association. The Property Commissioner is reporting on the matter.

Forest, Ont.—The electrical equipment for the new power plant in Forest is being supplied and installed by the Canadian Westinghouse Company, Ltd., and consists of one 70 k.v.a. a.c. generator, one 3½ k.w., 125 volt, direct-connected exciter and a two-panel switchboard.

Fredericton, N.B.—The Fredericton Gas Light Company recently purchased a 375 k.w. Westinghouse-Parsons turbo-generator, which is about ready for shipment from the East Pittsburg works of the manufacturer. A small direct connected engine-driven exciter is also included in the order.

Winnipeg, Man.—Separate sealed tenders addressed to Chairman, Board of Control, will be received at the office of the undersigned up to 11 a.m. on Wednesday, September 20th, 1913, for the supply of labor and materials necessary for or incidental to the erection of a duplicate transmission system on the present right-of-way of the City of Winnipeg between Point du Bois and Winnipeg. M. Peterson, Secretary.

Winnipeg, Man.—The Winnipeg Electric Railway Co., a Mackenzie & Mann enterprise, will build another big plant twelve miles farther down the river towards Lake Winnipeg. The new site is forty-five miles from Point du Bois, the civic plant's location. J. C. White & Co., New York contractors, will construct the plant, and the cost will run into four or five millions. The location is Grand Bonnet Falls. Two falls will be blown out. It is not thought it will affect detrimentally the civic plant.

Granby, Que.—C. J. McCuaig, of McCuaig Bros., Montreal, has made a proposal to the town to bring electric power from Drummondville, where he has acquired two power sites on the St. Francis River, capable of developing 8,000 horse power. He would buy out the present electric light plant and give a 24-hour service at the same rates as now paid, besides furnishing all the power required for manufacturing purposes. Mr. McCuaig will submit a proposition in writing to the Council and will meet them again so as to discuss the terms.

General Industrial

North Winnipeg, Man.—It is proposed to spend $30,000 on a new hospital here.

Sarnia, Ont.—Messrs. Stewart, Ltd., have prepared plans for an enlargement of their jam factory.

Medicine Hat, Alta.—The city has granted concessions to the Tabor Candy Co., who are building here.

Edmonton, Alta.—A 221-foot shaft is being sunk at a coal mine at St. Albert, Alta. Elevators will be installed.

Saskatoon, Sask.—The site for the storage elevator, which is to be built here by the Dominion Government has been chosen.

Regina, Sask.—W. G. Downing & Co., capitalized at $2,000,000, will move their plant for the manufacture of boots and shoes to this city.

Belleville, Ont.—It is stated that the Trenton Cooperage Company is going out of existence, and that a new set of financiers is taking their place.

Huntingdon, B.C.—The Huntingdon Glove Co. have moved their machinery to Vancouver, where the manufacture and offices will be located in future.

Penticton, B.C.—Mr. Kinnean, who is operating a dairy at Dog Lake, is understood to be interested in the establishment of a plant for sterilizing milk.

Wallaceburg, Ont.—D. A. Gordon, M.P., has recently been endeavoring to secure a chemical manufacturing plant for the town, to employ over 100 hands.

Moose Jaw, Sask.—Lake of the Woods Milling Co., have purchased the Moose Jaw Elevator Co.'s elevator at Manitoba Street. which has a capacity of 30,000 bushels.

London, Ont.—The National Gas mains being within three miles of the southern limits, the directors of the company will hold a conference with the city regarding distribution here.

Saskatoon, Sask.—The University Senate have asked the Government to carry out extensive additions to the university next year, including a laboratory, the improvements to cost $500,000.

Camrose, Alta.—The Camrose Natural Gas Co. have ordered six car loads of drilling machinery from Medicine Hat. They will drill for gas, which will be used first for the municipal light and power systems.

Brandon, Man.—C. H. Boyd, of Moose Jaw, president of the Canadian Faced Brick Process & Machine Company, Ltd., contemplates the erection of a plant at Brandon, Man., for making a patent water-proof brick.

St. Mary's Ont. — President Geo. Gooderham, Toronto, and other members of the St. Mary's Rock Cement Company, have been here to look over the cement works plant. It is rumored that the company contemplates doubling the capacity of the plant.

Regina, Sask.—Storey and Van Egmond, architects, are advertising for tenders for a factory and warehouse building for W. G. Downing and Co., Ltd. The building is to cost about $50,000, and will be erected at the corner of Rose street and 6th Avenue.

Pembroke, Ont.—A syndicate has approached the town council with a proposition to build a factory for the manufacture of hardwood specialities. They ask for a $5,000 site, a $25,000 loan, and a fixed assessment of $20,000. A committee has been appointed to meet them.

St. Thomas, Ont.—During a severe windstorm at Port Burwell the roof of the new canning factory there, owned by Fred. W. Fay & Co., was unroofed and other damage was done. The loss will be $1,000. The factory had been in operation only a few days.

St. Mary's, Ont.—The G. Carter, Son and Co. propose erecting a new flour mill of six storeys in height in order to increase their constantly increasing business in the export trade. It is proposed to capitalize a new company at $250,000. The town will be asked to guarantee bonds to the extent of $50,000.

Toronto, Ont.—News has been received from the head office of the R. F. Goodrich Tire & Rubber Company at Akron, Ohio, that the company has just decided to build a large Canadian branch in Toronto, which will employ 1,800 hands at the start. As yet the location of the factory is not known.

Montreal, Que.—A. J. Cline, representing Sir Thomas Lipton and a group of British capitalists of like calibre, is looking over Alberta and has stated that his company has decided to locate a glass factory which will employ three hundred men, in Western Canada. Medicine Hat is one of the points already under consideration.

Niagara Falls, Ont.—The Pollard Manufacturing Co., Ltd., makers of stone and marble-working machinery, derricks and electric hoists, advise that they have prepared plans for the erection of a new machine shop, 100 x 110 feet, to be of steel frame structure, with traveling crane. Steel sash will be used, and the building will be of the monitor type. Edson T. Pollard, president.

Refrigeration

Toronto, Ont.—W. R. Perrin, consulting architect, and engineer of the civic abattoir, has been awarded the contract for supplying the interior fittings and machinery for the abattoir. His tender was $108,376.

London, Ont.—The London Cold Storage Co., on Bathurst Street, have awarded a contract for refrigerating machinery, and for new buildings. This will be the first ice plant in the city, and will have a capacity of 100 tons daily.

The Triumph Ice Machine Co., Cincinnati, Ohio, have supplied the following refrigerating machinery in Canada: John Casorso, Kelowna, B.C., 10½-ton complete ice making and refrigerating plant; Montreal Abattoirs Co., Ltd., Montreal, Que., 125-ton refrigerating plant, with Corliss engine drive; C. R. Harris & Son, Ltd., dairymen, Toronto, Ont., complete 12-ton refrigerating plant, to be used in cooling milk, etc.; P. Burns Co., Victoria, B.C., 2-ton refrigerating machine for their branch depot at that plant. This large meat packing concern now have in operation six Triumph plants in various parts of British Columbia. Ice Manufacturing Co., Ltd., Montreal, Que., complete 70-ton ice making plant, electrically driven, with multiple effect evaporators for supplying required amount of distilled water; Ottawa Artificial Ice Co., Ltd., Ottawa, Ont., 50-ton ice making plant, electrically driven throughout, multiple effect evaporators being utilized to produce the necessary distilled water for the ice cans.

Wood-Working

Listowel, Ont.—The Andrew Malcolm Furniture Co., will extend its plant this fall. Headquarters are at Kincardine, Ont.

Massawippi, Que.—The W. A. Hunting & Co. erected their new sash and door factory last week. It is a two-storey building of good size.

Huntingdon, B.C.—The Colonial Sash and Door Co. recently erected a plant here, and are preparing to instal machinery. They will be operating this month.

Bridgeburg, Ont.—Damage estimated at $20,000 was caused at Bridgeburg, Ont., by fire, which destroyed the planing mill of O. C. Teal. The loss is partly covered by insurance.

Prince Albert, Sask.—At Big River, Sask, the planing mill of the Big River Lumber Co., two C. N. R. Box cars and eight flat cars were burned August 27 after the planing mill had been struck by lightning, in the most terrific electric storm seen here in years. The loss will throw 200 men out of employment.

Red Deer, Alta.—Fire destroyed the entire sawmill of the Valley City Lumber Company, 40 miles west of here, late August 29. The origin of the fire is a mystery. The building was only partly insured, having just been completed, and the loss will be large. W. H. Cushing, of Calgary, is the president, and E. Michener, M.P.P., and K. M. Byers, of Red Deer, are directors.

Marine

Collingwood, Ont.—The steamer Wexford has been put in drydock of the Collingwood Shipbuilding Co., and will have 40-50 plates removed. Recently she went aground at Lime Island.

Port Arthur, Ont.—The C. N. R. will negotiate with the Western Drydock and Shipbuilding Co. for the construction of two passenger lake liners, both of which, it is stated, will be larger than the Noronic.

Ottawa, Ont.—Tenders will be called for shortly for the largest of Canadian ice-breakers, to operate between Montreal and Quebec to facilitate the early opening of navigation in conjunction with the Montcalm and the Lady Grey. It will be 275 feet long, 57 feet wide, 32 feet deep, and will have a draught of 20 feet and 9,000 indicated horse-power.

Contracts Awarded

Montreal, Que.—The contract for constructing underground conduits along Bleury Street and St. Catharines Street, between Guy and Atwater, have been awarded to G. H. Guest, the lowest tenderer.

Cobalt, Ont.—The Northern Customs Concentrator Co. have awarded a contract to the Power and Mining Machinery Co. for 80 stamps, which are to be delivered to Cobalt within sixty days. This is claimed to be the largest single order for stamps placed in Canada.

Regina, Sask.—The new 1,500 k.w. unit, for the power house, ordered from Quilfor the power house, ordered from Willans & Robinson, Rugby, Eng., has arrived. The boilers, which have also arrived, were purchased from the Babcock-Wilcox Company. Each boiler has a capacity of 500 horse-power and a pressure of 200 pounds.

Sherbrooke, Que.—The Sherbrooke Machinery Company, Ltd., Sherbrooke, Que., has obtained the contract from the Abitibi Pulp and Paper Company, Ltd., for its entire equipment of wet machines, pneumatic savealls and screens, besides orders from the same company for 12 improved centrifugal screens.

Hamilton, Ont.—The Hydro-Electric Board this morning awarded to G. M. Guest, Montreal, the contract for the underground construction of the civic power plant. The price was $177,822, and does not include the wiring. The cost to the city will be about $80,000, and the rest of the $177,822 will be borne by the Cataract Power and telegraph companies.

Peterboro, Ont.—The following is a list of tenders received for the construction of concrete bridges on Park Street and the McDonnel intersection, the tenders being for two bridges: J. E. Hayes, $9,355; W. H. Lytle, $6,750; J. O. Sullivan and Moran, $12,500; The Hyland Construction Co., $8,075.28; Hickey & Carrol, $9,575; J. J. McNab,

Canadian Machinery Exhibition
January 1st—December 31st

¶ We were inspecting the exhibits at Machinery Hall last week and stopped to chat with a well-known manufacturer of machine shop equipment.

¶ We asked if much business was being done and if many inquiries were being received, and whether visitors were displaying interest in his exhibit.

¶ "As far as actual business is concerned, we don't care a hoot whether we do any or not." Replied the manufacturer. "We are not here for that. All we want or expect to do is to keep our name and our line before the public."

¶ "Of course," he continued, "we do some business and secure some prospects, but the publicity we get at the Toronto Exhibition is worth far more than the cost, and is what we desire most."

¶ The Canadian National is the finest Annual Exhibition in the World, and this year will probably attract over 1,000,000 visitors.

¶ The number of men interested in machinery, however, is small compared with the grand total, for, out of the million must be weeded the women and children, and the large body of visitors who do not know a lathe from a wheelbarrow.

¶ If it pays to advertise at the Toronto Exhibition for two weeks to a miscellaneous crowd, surely it ought to be even more profitable to advertise at an Exhibition that is in full swing the year round, and which is attended by a *select crowd* of *Machinery buyers.*

¶ *"Canadian Machinery and Manufacturing News"* is the one great Machinery Exhibition of Canada.

¶ The men who inspect your exhibit are real buyers, and if they do not see your display to-day, they will to-morrow or the following day.

¶ Everything in "Canadian Machinery" directly pertains to machinery, and is of interest to the men connected with the metal-working industry.

¶ There are no counter-attractions to divert their attention—no grand stand performances or midway, no imported bands and no jostling crowd.

¶ The carnival spirit is lacking at "Canadian Machinery" Exhibition, and the spirit of greater efficiency prevails.

¶ The manufacturer unwittingly uttered one of the best arguments in favor of advertising, and outlined its greatest function—that of keeping a firm's name and its line before the public.

¶ It will pay you to have an exhibit at "Canadian Machinery's" great Exhibition. Space costs but very little, and entries may be made at any time—the sooner the better.

Rate Card and full information gladly furnished

Canadian Machinery & Manufacturing News

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.

143 University Avenue, TORONTO

$11,800. The contract was awarded to W. H. Lytle.

Ottawa, Ont.—Contracts for the Toronto harbor improvements and for the second section of the Welland Canal will probably be let by the Government at the next Cabinet Council meeting, although there is some talk of delaying matters until the return of Hon. Messrs. Rogers and Cochrane. It is understood that the lowest tender for the Toronto harbor works is from a British firm, Messrs. Baldrey, Yerburgh and Hutchinson, who have an office in St. Catharines, Ont.

Tenders

Winnipeg, Man.—The Board of Control are planning the purchase of two turbine pumps at a cost of $13,590. Secretary of the board is M. Peterson.

Ottawa, Ont.—Tenders, addressed to the undersigned, and endorsed "Tender for Extension and Repairs to Revetment Wall at Meaford, Ont.," will be received at this office until 4 p.m. on Monday, September 29, 1913, for the construction of an extension and repairs to the revetment wall at Meaford, Ont. R. C. Desrochers, secretary, Department of Public Works, Ottawa.

Railways—Bridges

Saskatoon, Sask.—The town of Sutherland has granted a 20-year franchise to this city for the extension of the municipal railway.

Victoria, B.C.—Hon. Robert Rogers, Minister of Public Works, announces that he is looking for an engineer to undertake investigation of conditions prior to building a bridge across Seymour Narrows.

Saskatoon, Sask.—President Murray, on August 29, turned the first sod in connection with work on the new traffic bridge which will connect the University with the city. It will be the largest reinforced concrete bridge in Canada, and will cost $450,000.

Toronto, Ont.—Mr. Geary, corporation council, will endeavor to get some start made on the proposed Toronto and Suburban Railway on Pacific and Annette Sts., in West Toronto. The company were ordered to do this early in the year, but have been waiting for steel.

London, Ont.—Construction work on the concrete piers and abutments of the new Wharncliffe road bridge was started again last week. The work of the piers and abutments will be finished according to contract, about October 1. The steel work will be put on next spring, tenders having been called to be in by September 11.

Canora, Sask.—Tenders for the construction of a 126 foot span steel bridge on concrete abutments over the Whitesand river east of Canora have been let. The abutments will all be completed this fall, and the work of construction will be continued without interruption.

Guelph, Ont.—C. H. Mitchell, consulting engineer, Toronto, was in the city August 28, and examined the plans prepared by City Engineer Holland for the alterations to the Neve Street bridge. Mr. Mitchell approved of the plans and the Sewerage and Public Works Commission will commence work for an additional span and a 200-foot retaining wall as soon as possible.

Building Notes

Calgary, Alta.—Money by-laws providing for the expenditure of $500,000 on Calgary exhibition plant, will be submitted to the ratepayers.

Toronto, Ont.—The Standard Bank of Canada has been granted a permit from the City Architect's Department for new premises at Queen Street and Brock Avenue. The building, to be of brick and stone, will cost $30,000.

Toronto, Ont.—The Victoria Paper & Twine Co. have announced their intention of putting up a four-storey warehouse on Wellington Street, immediately west of the Loretto Abbey. The building will have a frontage of 50 feet and a depth of 210 feet, leaving 18 feet in the rear vacant. Solid brick construction will be used, and the cost will be about $60,000.

Toronto, Ont.—Plans have been completed for the new hotel to be erected at the north-east corner of King and Simcoe Streets. It is to be a twelve-storey structure, and will be erected by Mr. Lawrence Solman. The new hostelry will have 140 bedrooms, and the front will be of terra cotta. The property has a frontage of 45 feet on King Street and 100 feet on Simcoe.

Water-Works

Bedford, Que.—The ratepayers voted on Wednesday, September 3rd on a scheme to erect a waterworks system at a cost of $35,000.

MacLeod, Alta.—The town is thinking of putting in a sewage disposal plant, and the council will shortly visit Lethbridge, Edmonton, Ponoka for the purpose of inspection.

Edmonton, Alta.—City Engineer Latornell has recommended a sewage disposal plant to handle sewage from both sides of the river. This would mean erection of a syphon in the river.

Toronto, Ont.—Work on the new sewage disposal plant at the Industrial Farm, Thornhill, began last week. The plant is somewhat in the nature of an experiment, to test the merits of the system which it is proposed to instal in the civic sewage disposal plant. The equipment consists of Imhoff tanks and trickling filters.

New Westminster, B. C.—Work on the concrete dams across the Nicomeki and Serpentine Rivers has been completed by the contractors, M. B. Cotton Co., and the dyking commissioners, Messrs. T. J. Sullivan, B. B. Smith and H. Bose, together with their engineer, Mr. H. C. Brice, C. E.., of New Westminster, are about at the end of their biggest task. The work in all has cost some $135,000.

Trade Gossip

Want Manufacturers' Convention. —Winnipeg members of the Canadian Manufacturers' Association are already campaigning to bring the annual convention of the association for 1914 to Winnipeg. Delegates to the convention at Halifax this year, which is scheduled for Sept. 16 to 18, will make a big fight for the honor and will have the backing of Mayor Deacon and the city council in the shape of a formal invitation to the association.

Personal

Henry F. Clayton, general manager of the Boving Company of Canada, is out West on a business trip.

John C. Bayliss, a well-known contractor of Toronto, died at his summer residence at Dixie on August 17th.

Chas. F. Barnes has been appointed acting manager of the London Electric Company, succeeding E. I. Jenking.

Moses Antipitzky, the well-known scrap metal dealer of Grange Avenue, Toronto, who died recently, left an estate valued at nearly $57,000.

Frank Barber, C.E., bridge and structural engineer, Toronto, has recovered from an illness extending over several months, and is at his office again.

W. J. Healey, formerly of Toronto, has been appointed manager of the branch plant at the Burroughs Adding Machine Co., of Detroit, who are planning to build in Windsor, Ont.

A. Woodroffe Manton, M.I.C.E., B.Sc., resident engineer in Constantinople for the engineering firm of S. Pearson & Son, Limited, with headquarters at London, England, is in Toronto at present forming a Canadian office for his firm.

Medicine, Hat, Alta.—C. L. White, who has been for some time manager of the Alberta Clay Products Company, Medicine Hat, Alta., is severing his connection with that firm to become business manager of the International Supply Company.

Works Commissioner Harris, of Toronto, is reported to have been offered the position of City Engineer of Vancouver. He refused to discuss the matter when questioned, but stated that if people of Toronto were satisfied with his work, he was satisfied to remain there.

Fred W. Vollans and **F. E. Fisher,** who are interested in the new Walkerville Company, named The Fisher Motor Co., Ltd., and who have purchased the plant and business of the Tudhope Motor Co., Ltd., of Orillia, Ont., were both at Toronto Exhibition last week, where they are showing their new electric welder.

F. L. Fellowes, City Engineer of Vancouver, receiving a salary of $8,000 a year, the highest figure paid by any city in Canada, has been given six months' notice to terminate his agreement. He went to Vancouver from Westmount three years ago. The resignation was asked as a result of water pipes approved by his eastern representative being found below the standard, causing the city a loss of several thousand dollars.

R. N. Austin has been appointed manager of the Toronto office of Turbine Equipment Co., Ltd., engineers of 30 Church Street, New York. Mr. Austin was for six years with the Canada Foundry Co.—two years at the Davenport works, and the last four in the capacity of sales engineer for the Ontario district office, during which period most of his work was in connection with turbine pumps. The above company is the special selling agent for the De Laval Steam Turbine Co., Trenton, N.J.

Catalogues

The Canadian Steam Boiler Equipment Co., Toronto, has issued a pamphlet dealing with the ''cyclone shaking and dumping grate bar'' which they manufacture. The apparatus is fully described and illustrated, the principal features being clearly explained. The pamphlet also contains some testimonials and a list of users. Copies may be had on request.

Alldays & Onions Co., Ltd., Birmingham, England, have sent us a copy of section ''A'' of their catalog describing their ''Anchor'' brand vises, anvils, smith's tools, etc. This firm manufacture a full line of smith's tools, each specialty being clearly illustrated, together with principal dimensions and

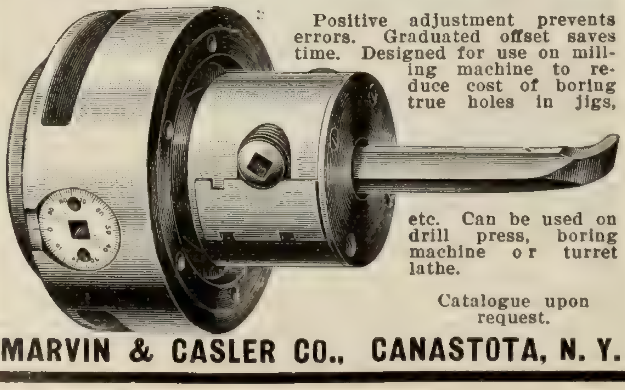
Toronto and Montreal

To .001″ Casler Offset Boring Head



Positive adjustment prevents errors. Graduated offset saves time. Designed for use on milling machine to reduce cost of boring true holes in jigs, etc. Can be used on drill press, boring machine or turret lathe.

Catalogue upon request.

MARVIN & CASLER CO., CANASTOTA, N. Y.

Lanco Balata Belting

is made of best 38 oz. cotton duck, well stretched, etc., and thoroughly impregnated with **pure** Balata gum. Let us send you our interesting and useful belt book explaining how this belt meets your requirements. Ask for "Main Drive" Book.

Sheldons Limited, Galt.
The Smart-Turner Machine Co., Hamilton.

You Canadians Who Attend the

Foundry and Machine Exhibititon

International Amphitheatre, CHICAGO
OCTOBER 10-17

Will Bring Home The Bacon

Ideas you need in your business and **Information** regarding new tools and methods that will enable you to outstrip your competitor will result from your visit to this great business convention.

The following partial list of exhibits gives some idea of the scope of the display:

Classification of Exhibits

Abrasive materials.
Adding machines.
Air compressors.
Belt lacing machines.
Blastmeters.
Blowers, cupola.
Boring machines, vertical.
Boring machines, horizontal.
Boring mills.
Broaching machines.
Carborundum products.
Cars, industrial.
Chain blocks.
Chucks, drill.
Chucks, lathe and planer.
Clutches, friction.
Controllers, electric.
Converters, steel.
Core machines.
Core ovens.
Cranes, electric.
Crucibles, retorts, etc.
Cupolas.
Cutters, gear and milling.
Cutting-off machines and tools.
Cutting, oxy-acetylene.
Drill grinding machinery.
Drill presses, multiple spindle.
Drilling machines.
Drills.
Drills, radial.
Dust collectors.
Dynamos.
Electrical supplies.
Electro-plating machinery.
Electro-platers' supplies.
Elevators, electric.
Fans, electric and exhaust.
Factory construction material.
Fire-brick, cupola block.
Flasks, aluminum, iron, wood.
Foundry equipment, iron, brass.
Foundry supplies, etc.
Furnaces, melting.
Furnaces, annealing and tempering.
Furnaces, electric.
Gear cutting machines.
Gear hobbers.
Graphite.
Grinding tools.
Grinding wheels, alundum.
Grinding wheels, carborundum.
Grinding and polishing machinery.
Grinders, disc and surface.
Grinders, plain and universal.
Hack saw machines, power.
Hoisting and conveying machinery.
Hoists, electric, pneumatic.
Hoists, portable.
Ingot metals.
Keyseaters.
Ladle heaters.
Lathes, engine and turret.
Lathes, wood and pattern.
Lubricants.
Mch. shop tools, supplies.
Matchplates.
Milling machines, horizontal and vertical.
Mold dryers.
Molding machines, automatic.
Molding machines, hand and power.
Motors and generators.
Pattern shop machinery.
Pattern and box lumber.
Pig iron.
Planers.
Pneumatic tools.
Polishing and plating machinery.
Pulleys, metal and wood.
Punches, power and hand.
Pyrometers.
Radial drills.
Riveters, pneumatic.
Sandblast machinery and equipment.
Sandblast accessories.
Sand mixing machinery.
Saw sharpening machines.
Screw machines.
Separators, magnetic.
Shapers.
Slotters.
Sprue cutters.
Tool room grinders.
Track, industrial.
Tramrail systems.
Trolleys.
Trucks, hand and electric.
Turret machines, vertical.
Turntables.
Vertical turret lathes.
Vibrators.
Welding machines, oxy-acetylene.
Welding and cutting compounds.
Woodworking machinery.

Coincident with the exhibition will be held the Annual Conventions of the Allied Foundry Associations. Many valuable discussions that no progressive foundryman can afford to miss are on the program.

The Chicago Committee is providing special entertainment for the visiting foundrymen and their friends.

For Further Particulars Address C. E. HOYT, Secretary

FOUNDRY & MACHINE EXHIBITION COMPANY
HOTEL SHERMAN, CHICAGO

Engravers.
Pritchard-Andrews Co., Toronto.

Equipment, Shop.
Garvin Machine Co., New York.

Escutcheon Pins.
Parmenter & Bulloch Co., Gananoque.
Steel Co. of Canada, Hamilton, Ont.

Exhaust Heads and Hoods.
Can. Buffalo Forge Co., Montreal.
Can. Fairbanks-Morse Co., Montreal.
Darling Bros., Ltd., Montreal.
Sheldon Limited, Galt, Ont.
Hare Eng. Co., Toronto.

Exhausters.
Can. Buffalo Forge Co., Montreal.
Sherbrooke Machinery Co., Sherbrooke, Que.

Experimental Machinery.
Schofield-Holden Machine Co., Ltd., Toronto.

Fans.
Can. Buffalo Forge Co., Montreal.
Canadian Westinghouse Co., Hamilton.
Peacock Bros., Montreal.
Sheldons Limited, Galt, Ont.
The Smart-Turner Machine Co., Hamilton.

Feed Water Heaters.
Can. Fairbanks-Morse Co., Montreal.
Hare Eng. Co., Toronto.
Inglis Co., John, Toronto.
International Engineering Works, Ltd., Amherst, N.S.
Jenckes Machine Co. Ltd. Sherbrooke, Que.
Peacock Bros., Montreal.
The Smart-Turner Machine Co., Hamilton.

Files.
Delta File Works, Philadelphia, Pa.
Nicholson File Co., Port Hope, Ont.
Simonds Mfg. Co., Fitchburg, Mass.

Fire Escapes.
Geo. B. Meadows, Toronto.

Fire Sprinklers, Automatic.
General Fire Equipment Co., Toronto.

Fire Extinguishers.
General Fire Equipment Co., Toronto.

Flanged Pulleys.
American Pulley Company, Philadelphia.

Flexible Shafts.
Schofield-Holden Machine Co., Ltd., Toronto.
Stow Mfg. Co., Binghampton, N.Y.

Forges, Hand, etc.
Can. Buffalo Forge Co., Montreal.
Independent Pneumatic Tool Co., Chicago, Ill.
National Machine & Supply Co., Hamilton.
W. S. Rockwell Co., New York.
Sheldons Limited, Galt, Ont.

Forges, Oil Rivet.
Can. Buffalo Forge Co., Montreal.
W. S. Rockwell Co., New York.

Forgings, Drop, Automobile and Locomotive.
Bliss, E. W., Co., Brooklyn, N.Y.
Canadian Billings & Spencer, Ltd., Welland.
Steel Co. of Canada, Hamilton, Ont.
J. H. Williams & Co., Brooklyn, N.Y.

Forging Hammers, Pneumatic.
E. W. Bliss, Co., Brooklyn, N.Y.
Peacock Bros., Montreal.

Forging Machinery.
John Bertram & Sons Co., Dundas.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

Air Compressors.
- Cleveland Pneumatic Tool Co. of Can., Toronto.
- Canadian Ingersoll-Rand Co., Ltd., Montreal.
- Curtis & Co., Mfg. Co., St. Louis, Mo.
- Detroit Foundry Supply Co., Windsor,
- E. J. Woodison Co., Toronto.

Alloys.
- Hermann Boker & Co., Montreal.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry Sup. Co., Montreal.
- Frederic B. Stevens, Detroit.
- E. J. Woodison Co., Toronto.

Ammeters.
- Bennett-O'Connell Co., Chicago.
- Detroit Foundry Supply Co., Windsor, Ont.
- E. J. Woodison Co., Toronto.
- W. W. Wells, Toronto.

Autogenous Welding
- W. D. Beath & Son, Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.

Barrels, Tumbling.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor.
- Dominion Fdry Sup. Co., Montreal.
- Federal Fdry. Supply Co., Cleveland.
- Frederic B. Stevens, Detroit.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Northern Crane Works, Ltd., Walkerville, Ont.
- E. J. Woodison Co., Toronto.
- Whiting Foundry Equipment Co., Harvey, Ill.
- W. W. Wells, Toronto.

Blowers.
- Can. Buffalo Forge Co., Montreal.
- Can. Hanson & Van Winkle Co., Toronto.
- Canadian Ingersoll-Rand Co., Ltd., Montreal.
- Detroit Foundry Supply Co., Windsor,
- Dominion Fdry Sup. Co., Montreal.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Monarch Eng. & Mfg. Co., Baltimore,
- J. W. Paxson Co., Philadelphia, Pa.
- W. S. Rockwell Co., New York.
- E. J. Woodison Co., Toronto.

Blast Gauges—Cupola.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry Sup. Co., Montreal.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Sheldon's, Limited, Galt.
- Frederic B. Stevens, Detroit.
- E. J. Woodison Co., Toronto.

Brass Melting Furnaces.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry Sup. Co., Montreal.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Monarch Eng. & Mfg. Co., Baltimore,
- J. W. Paxson Co., Philadelphia, Pa.
- W. S. Rockwell Co., New York.
- Frederic B. Stevens, Detroit.
- Whiting Foundry Equipment Co., Harvey, Ill.
- E. J. Woodison Co., Toronto.

Brushes, Foundry and Core.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor.
- Dominion Fdry Sup. Co., Montreal.
- B. Greening Wire Co., Hamilton, Ont.
- Federal Fdry. Supply Co., Cleveland.
- Osborn Mfg. Co., Cleveland, O.
- J. W. Paxson Co., Philadelphia, Pa.
- Frederic B. Stevens, Detroit, Mich.
- E. J. Woodison Co., Toronto.

Burners, Core Oven.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- Monarch Eng. & Mfg. Co., Baltimore,
- Osborn Mfg. Co., Cleveland, O.
- W. S. Rockwell Co., New York.
- Frederic B. Stevens, Detroit, Mich.
- E. J. Woodison Co., Toronto.

Cars, Core Oven.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- Monarch Eng. & Mfg. Co., Baltimore,
- Osborn Mfg. Co., Cleveland, O.
- Whiting Foundry Equipment Co., Harvey, Ill.
- E. J. Woodison Co., Toronto.

Cars, Foundry.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Monarch Eng. & Mfg. Co., Baltimore,
- Frederic B. Stevens, Detroit, Mich.
- Whiting Foundry Equipment Co., Harvey, Ill.
- E. J. Woodison Co., Toronto.

Charcoal.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor.
- Dominion Fdry. Sup. Co., Toronto.
- Frederic B. Stevens, Detroit, Mich.
- E. J. Woodison Co., Toronto.

Chaplets.
- Hill & Griffiths Co., Cincinnati, O.

Clay Lined Crucibles.
- McCulloch-Dalzell Crucible Company, Pittsburg, Pa.

Core Binders.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- J. W. Paxson Co., Philadelphia, Pa.
- Robeson Process Co., Au Sable Forks, N.Y.
- E. J. Woodison Co., Toronto.

Core Box Machines.
- Dominion Fdry. Sup. Co., Toronto.
- J. W. Paxson Co., Philadelphia, Pa.
- E. J. Woodison Co., Toronto.

Core Cutting-off and Coning Machine.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Montreal.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- E. J. Woodison Co., Toronto.

Core Compounds.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor.
- Dominion Fdry Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- J. W. Paxson Co., Philadelphia, Pa.
- Robeson Process Co. Pennington, N.J.
- Stevens, F. B., Detroit, Mich.
- E. J. Woodison Co., Toronto.

Core Machines, Hammer.
- Brown Specialty Machinery Co., Chicago, Ill.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.

Core-Making Machines.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Montreal.
- Federal Fdry. Supply Co., Cleveland.
- J. W. Paxson Co., Philadelphia, Pa.
- Stevens, F. B., Detroit, Mich.
- E. J. Woodison Co., Toronto.

Core Oils.
- Cataract Refining Co., Buffalo, N.Y.
- Detroit Foundry Supply Co., Windsor, Ont.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Holland Core Oil Co., Chicago.
- Federal Fdry. Supply Co., Cleveland.
- E. J. Woodison Co., Toronto.

Core Ovens.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor
- Dominion Fdry. Sup. Co., Montreal.
- Federal Fdry. Supply Co., Cleveland.
- Hamilton Facing Mill, Co., Ltd. Hamilton. Ont.
- Monarch Eng. & Mfg. Co., Baltimore.
- Oven Equipment & Mfg. Co., New Haven, Conn.
- Swindell, Wm. & Bros., Pittsburgh, P.
- Stevens, F. B., Detroit, Mich.
- Whiting Foundry Equipment Co., Harvey, Ill.
- E. J. Woodison Co., Toronto.
- Wright Mfg. Co., Lisbon, O.

Core Wax.
- United Compound Co., Buffalo, N. Y.

Core Sand
- Summit Silicia Co., B.

Cranes, Travelling and Jib.
- W. D. Beath & Son, Toronto.
- Curtis Pneumatic Machinery Co., St. Louis, Mo.
- Northern Crane Works, Ltd., Walkerville, Ont.

Cranes, Electric and Hand Power.
- Advance Machine Wks., Walkerville.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Bridge Co., Montreal.
- Dominion Fdry. Sup. Co., Montreal.
- Mussens, Limited, Montreal.
- Northern Crane Works, Walkerville, Ont.
- Whiting Foundry Equipment Co., Harvey, Ill.
- E. J. Woodison Co., Toronto.

Cranes, Hand Travelling
- Wright Mfg. Co., Lisbon, O.

Cranes, Hydraulic.
- Dominion Fdry. Sup. Co., Montreal.
- Whiting Foundry Equipment Co., Harvey, Ill.
- E. J. Woodison Co., Toronto.

Crucibles.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dixon Crucible Co., Joseph, Jersey City, N.J.
- Dominion Fdry. Sup. Co., Toronto.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Seidel, R. B., Philadelphia.
- Stevens, F. B., Detroit, Mich.
- E. J. Woodison Co., Toronto.
- McCulloch-Dalzell Crucible Company, Pittsburg, Pa.

Cupolas.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor,
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Monarch Eng. & Mfg. Co., Baltimore, Md.
- Northern Crane Works, Ltd., Walkerville, Ont.
- J. W. Paxson Co., Philadelphia, Pa.
- Elk Fire Brick Co., Hamilton, Ont.
- Stevens, F. B., Detroit, Mich.
- Whiting Foundry Equipment Co., Harvey, Ill.
- E. J. Woodison Co., Toronto.

Cupola Blast Gauges.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- J. W. Paxson Co., Philadelphia, Pa.

Cupola Blocks.
- Bailey & Son, R., Toronto.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor
- Dominion Fdry. Sup. Co., Toronto.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- J. W. Paxson Co., Philadelphia, Pa.
- Stevens, F. B., Detroit, Mich.
- E. J. Woodison Co., Toronto.

Cupola Blowers.
- Can. Buffalo Forge Co., Montreal.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor,
- Dominion Fdry. Sup. Co., Toronto.
- Monarch Eng. & Mfg. Co., Baltimore, Md.
- J. W. Paxson Co., Philadelphia, Pa.
- Stevens, F. B., Detroit, Mich.
- E. J. Woodison Co., Toronto.

Cupola Linings.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- J. W. Paxson Co., Philadelphia, Pa.
- Stevens, F. B., Detroit, Mich.
- E. J. Woodison Co., Toronto.

Cupola Twyers.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- J. W. Paxson Co., Philadelphia, Pa.
- E. J. Woodison Co., Toronto.

Cutting-off Machines.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- E. J. Woodison Co., Toronto.

Drying Ovens for Cores.
- Oven Equipment & Mfg. Co., New Haven, Conn.

Elevators, Foundry, Hydraulic, Pneumatic.
- W. D. Beath & Son, Toronto.
- Canadian Ingersoll-Rand Co., Ltd., Montreal.
- Schofield-Holden Machine Co., Ltd., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry Sup. Co., Montreal.
- E. J. Woodison Co., Toronto.

Emery Wheels.
- Adamite Wheel & Mfg. Co., Hamilton, Ont.
- Detroit Foundry Supply Co., Windsor, Ont.
- W. W. Wells, Toronto.

Fans, Exhaust.
- Can. Buffalo Forge Co., Montreal.
- Can. Hanson & Van Winkle Co., Toronto.
- Can. Fairbanks-Morse Co., Montreal.
- Detroit Foundry Supply Co., Windsor.
- Dominion Fdry Sup. Co., Montreal.
- Frederic B. Stevens, Detroit.
- Hamilton Facing Mill Co., Ltd. Hamilton, Ont.
- E. J. Woodison Co., Toronto.

Fillers (Metallic).
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- Frederic B. Stevens, Detroit.
- Shelton Metallic Filler Co., Derby, Conn.
- Frederic B. Stevens, Detroit.
- E. J. Woodison Co., Toronto.

Fillets, Leather & Wooden.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- E. J. Woodison Co., Toronto.

Fire Brick and Clay.
- Bailey & Son, R., Toronto.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor,
- Elk Fire Brick Co., Hamilton, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Monarch Eng. & Mfg. Co., Baltimore, Md.
- J. W. Paxson Co., Philadelphia, Pa.
- Frederic B. Stevens, Detroit.
- E. J. Woodison Co., Toronto.
- Whitehead Bros. Co., Buffalo, N.Y.

Fire Sand.
- Summit Silicia Co., Barberton, Ohio.
- Whitehead Bros. Co., Buffalo, N.Y.

Flasks, Snap, Etc.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor.
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- J. W. Paxson Co., Philadelphia, Pa.
- John Tuohy, Pittsburgh, Contra Costa County, California.
- Sterling Wheelbarrow Co., West Allis, Wis.
- E. J. Woodison Co., Toronto.

Foundry Coke.
- Can. Hanson & Van Winkle Co., Toronto.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Stevens, F. B., Detroit, Mich.
- E. J. Woodison Co., Toronto.

Foundry Equipment.
- W. D. Beath & Son, Toronto.
- Can. Hanson & Van Winkle Co., Toronto.
- Canadian Ingersoll-Rand Co., Ltd., Montreal.
- Detroit Foundry Supply Co., Windsor, Ont.
- Dominion Fdry. Sup. Co., Toronto.
- Federal Fdry. Supply Co., Cleveland.
- Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
- Monarch Eng. & Mfg. Co., Baltimore, Md.
- Northern Crane Works, Walkerville, Ont.
- J. W. Paxson Co., Philadelphia, Pa.
- Stevens, F. B., Detroit, Mich.
- Sterling Wheelbarrow Co., Wisconsin.
- Whiting Foundry Equipment Co., Harvey, Ill.
- E. J. Woodison Co., Toronto.
- Osborn Mfg. Co., Cleveland, O.

Foundry Parting.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor,
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.
Whitehead Bros. Co., Buffalo, N.Y.

Foundry Facings.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor,
Dominion Fdry. Sup. Co., Toronto.
Federal Fdry. Supply Co., Cleveland.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Monarch Eng. & Mfg. Co., Baltimore, Md.
J. W. Paxson Co., Philadelphia, Pa.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.
Whitehead Bros. Co., Buffalo, N.Y.

Furnace Lining.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor, Ont.
Dominion Fdry. Sup. Co., Toronto.
Hamilton Facing Mill, Co., Ltd. Hamilton, Ont.
Hawley Down Draft Furnace Co., Easton, Pa.
Monarch Eng. & Mfg. Co., Baltimore, Md.
Stevens, F. B., Detroit, Mich.
E. J. Woodison Co., Toronto.

Furnaces.
Can. Hanson & Van Winkle Co., Toronto.
Detroit Foundry Supply Co., Windsor.

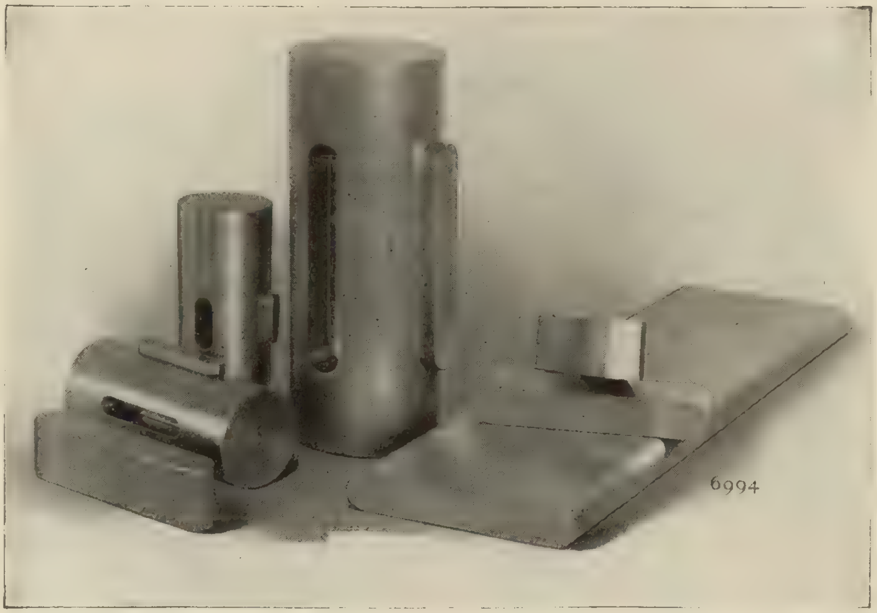
CANADA MACHINERY CORPORATION, LIMITED

GALT, ONTARIO

Builders of Machine Tools and Wood Working Machinery

With This Machine You Can Use Rectangular Keys Profitably



For many reasons, some of which are enumerated below, the rectangular type of key shown here is considered superior to any other. Until the development of the

P & W Spline Milling Machine

the excessive cost of milling the keyways has prevented their commercial use. With this machine the keyways are milled in one simple, rapid operation.

Rectangular Keys by far the most Efficient and Economical.

1.—They do not materially weaken the shaft.

2.—They will not work loose.

3.—Their shearing strength is practically equal to a solid member.

4.—Two keys may be placed opposite each other on the shaft.

COST OF CUTTING KEYWAYS GREATLY REDUCED.

For keyways and slots the Spline Milling Machine has proven the greatest labor saving machine that has ever been produced. The metal is removed very rapidly and an accurate keyway or slot is cut in a remarkably short time. Automatic features enable one operator to take care of from six to eight machines in some instances.

Accurate Machine Keys Ready to Drive in

without fitting, any width, depth or taper; finished and guaranteed to micrometer measurements, can be obtained from the STANDARD GAUGE STEEL COMPANY, BEAVER FALLS, PA.

Write for descriptive circular "Spline Milling Machine."

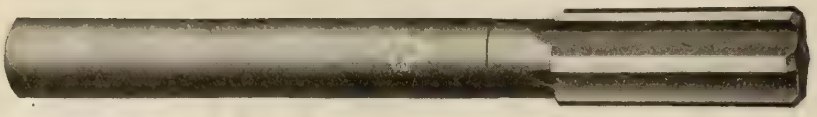
TORONTO MONTREAL



"W & B" Reamers Are Backed For Long Service

There are many qualities which, taken as a whole, make up the efficiency of "W & B" Reamers.

With the exception of a few slight differences of design, there is little by which reamer quality can be judged before actual working tests.

We make it easy for our many friends to insure the selection of tools of known merit. Every tool, whether large or small, that leaves our plant is stamped with either one of the "W & B" Diamond Trade Marks shown below.

If you have used any tool with the "W & B" Diamond Trade Mark, you will naturally want all your tools of the same high quality.

Watch for the Trade Mark and you'll get all good tools can give.

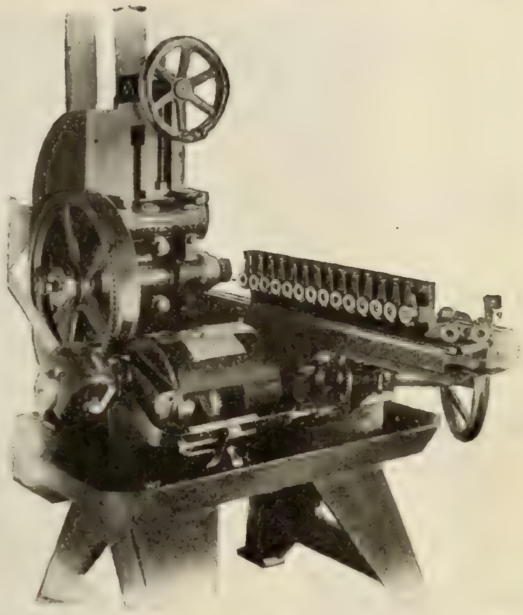
KEMPSMITH No. 32 Lincoln Miller



Built for rapid production of duplicate parts.

Illustrating methods of facing large quantities of small levers.

Jigs designed for quick action in loading and unloading.

Speed of spindle, 78 r.p.m.

Rate of table feed .158" per revolution of spindle.

Table travel 12¼" per minute.

Total time for each piece, less than ½ minute.

This method shows a large saving over best previous lathe time.—Have you not some work that could be handled this way?

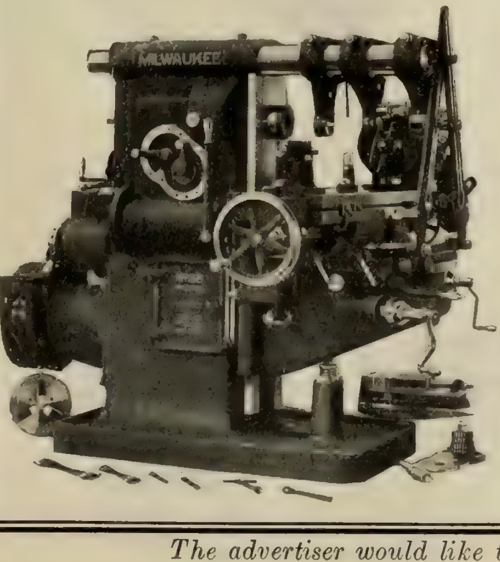
THE KEMPSMITH MFG. COMPANY

MILWAUKEE, WISCONSIN

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 5—
The Flanged Spindle

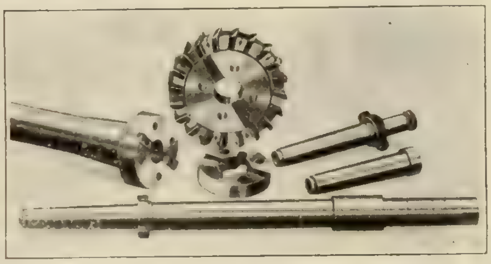
Our former practice (and the present practice of other milling machine builders) was to thread the end of the spindle so that cutters, chucks, or other tools, and in some instances clutch drive collars could be screwed onto it. The collars were notched to receive dogs on the cutter arbor, and in some instances the spindle itself is notched for this purpose.



As machines grew in size and power, this method proved defective for the reason that the collar or arbor would set tight on the thread and could not be removed without difficulty.

We therefore devised and patented the flanged spindle. The end of the spindle is flanged and is faced across the end **without any thread.** A keyseat, milled across this face, receives a key which is used to drive either the notched collar that fits the dogs on the arbor or face milling cutters which have a keyseat across the back face corresponding with the key in the face of the spindle.

Four screws are used to hold either the cutter or the arbor drive collar to the spindle. In the case of the cutter, a plug is fitted in the taper hole of the spindle to centre the cutter accurately.



In this way locking of the abor or the collar into the threaded spindle is eliminated. The arbor drive collar protects the end of the spindle so that it maintains its accuracy. Face milling cutters can be driven either right or left hand, which was impossible with the old method as the cutters obviously would unscrew from the thread if driven in the opposite direction. These advantages have proven of great practical value to all Milwaukee Miller users.

Our Bulletins give the "WHYS" in favor of Milwaukee Millers in exactly the form you want them—complete and in detail. Shall we mail your copies?

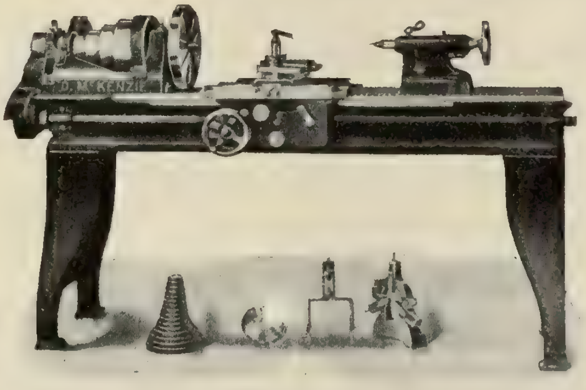
"McKenzie" Engine Lathes



Made from New Patterns and of Improved Design

Powerful Accurate

This Lathe has all gear feeds. The different feeds can be had by changing the intermediate gear on quadrant.

Spindle is of high carbon steel, and runs in bronze bearings carefully hand scraped and fitted.

Tail Stock is the cut-a-way type, allowing the compound rest to be set parallel with bed.

Compound Rest is graduated in degrees, and both upper and lower screws have index collars.

Just the Lathe you need in your shop. Ask for full particulars.

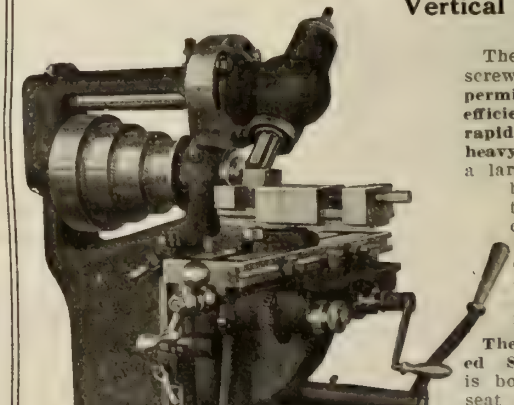
D. McKenzie, Guelph, Ont.

This machine will increase your output at less labor cost.

It embodies the latest ideas and the work of skilled mechanics, and is essential to every up-to-date shop.

No. 3 Rockford Hand Miller

For Horizontal or Vertical Milling



The combination screw and lever feed **permits maximum efficiency for light, rapid cuts and for heavy work,** where a large stock must be removed, the two feeds do not interfere, and a change from one to the other can be made instantly.

The Patent Flanged Support which is bolted and near seat of column, reduces vibration and increases cutting capacity.

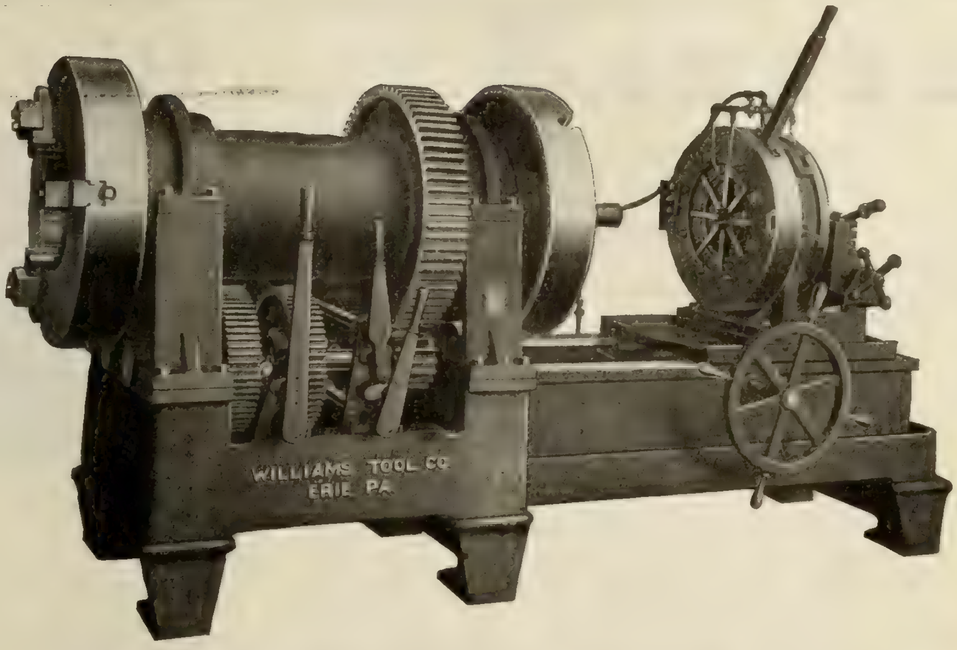
This is just the machine you need. Get particulars.

Rockford Milling Machine Co.
ROCKFORD, ILLINOIS, U.S.A.

A Pipe Machine might be built that outwardly would resemble the Williams But it would be a difficult matter to equal the superior quality and efficiency of the Williams Machine. These represent years of patient experiment with various metals and processes for tempering and hardening steel.

It is simply astonishing how slight a variation in the degree of hardness or angle of clearness seriously affects the cutting and lasting quality of pipe machine dies.

Why take chances? Why not have the machine that has been tried and tested in 1500 shops and not found wanting.



Drop us a line stating capacity of machine in which you are interested.

A Person and a Personality

¶ Seneca, a great Roman writer and philosopher, once said, "We complain that life is too short, yet we live each day as if it were a thousand years."

¶ The life of the average individual is principally occupied in rendering excuses, making explanations, and in listening to idle gossip.

¶ The average man makes but little of his chances, which assertion is proved by the fact that a few men in one day of eight hours often accomplish more than many men in a lifetime of seventy years.

¶ Life is simply a matter of concentration. You are what you set out to be. The things you read to-day and the things you think to-day are the things you become to-morrow. You are a composite of the things you say, the books you read, the thoughts you think, the company you keep and the things you aspire to become.

¶ So, then, here is a recipe for improving the individual and evolving your life into success. Time is your only asset. Each moment is a golden treasure and the way you spend it shapes your life as an individual.

¶ If you would simply devote thirty minutes of each day to the study of some splendid idea, to the improvement of your mind, in obtaining a more accurate knowledge of your business, in studying the thoughts of some great man who has left the world better because of his having lived, in search of the secret of the success of great business men, you would in ten years' time evolve into a giant of intellectual strength with power to follow any plan or idea to final and positive success.

¶ That is what you can actually do through the right investment of thirty minutes of each day.

¶ Time knows no prejudices, makes no promises, keeps no records and asks no questions. You are here for a purpose and each moment you spend foolishly or frivolously is lost for all time—simply thrown into the waste-basket of indifference. You come into this world from an eternity of which you know but little, watch the hour hand on the face of time for a little while and return to that eternity from which you have come.

¶ Unless you know the value of each moment as an investment, each day that passes is only a stumbling block that sends you blundering on into the indifference, helplessness and decline of old age.

¶ Then the question is—what are you going to do with each hour and what are you going to do with life? Are you going to drift through its wealth and beauty, satisfied with your inefficiency, incompetency, idleness and ignorance? Are you going to leave untouched the treasures of the world in which you live? Are you going to betray yourself and your chances?

¶ Are you going to remain content with your own limited knowledge when you can keep in touch with the great thoughts and ideas of the great men who have influenced the world? Are you going to bury your head in your desk and shut out the light of experience and the success of other men

¶ In other words—are you going to be a failure and in the evening of life go down the other side without having accomplished some great and splendid thing? Are you going to use these thirty minutes each day, to know more, to learn more and to understand? It is up to you.

¶ Opportunity is pounding a perpetual tattoo on your door and follows you with a club from the time of your rising to the time of your retiring. The question is—are you to be a person or a personality?

¶ The way you invest this half hour is going to decide, and your life's work will say if you have been a success or if your life has been a travesty—a mockery filled with idleness, indifference and uselessness.

¶ Do you believe in your work, in loyalty to your employer, in devotion to your business? Do you believe in honest service, in honest thought, in the divinity of the thing you do or the thing you sell? Do you intend to be an individual or a nonentity? As a man it is absolutely and entirely up to you. Are you going to get busy and when you do you expect to begin?

Efficiency

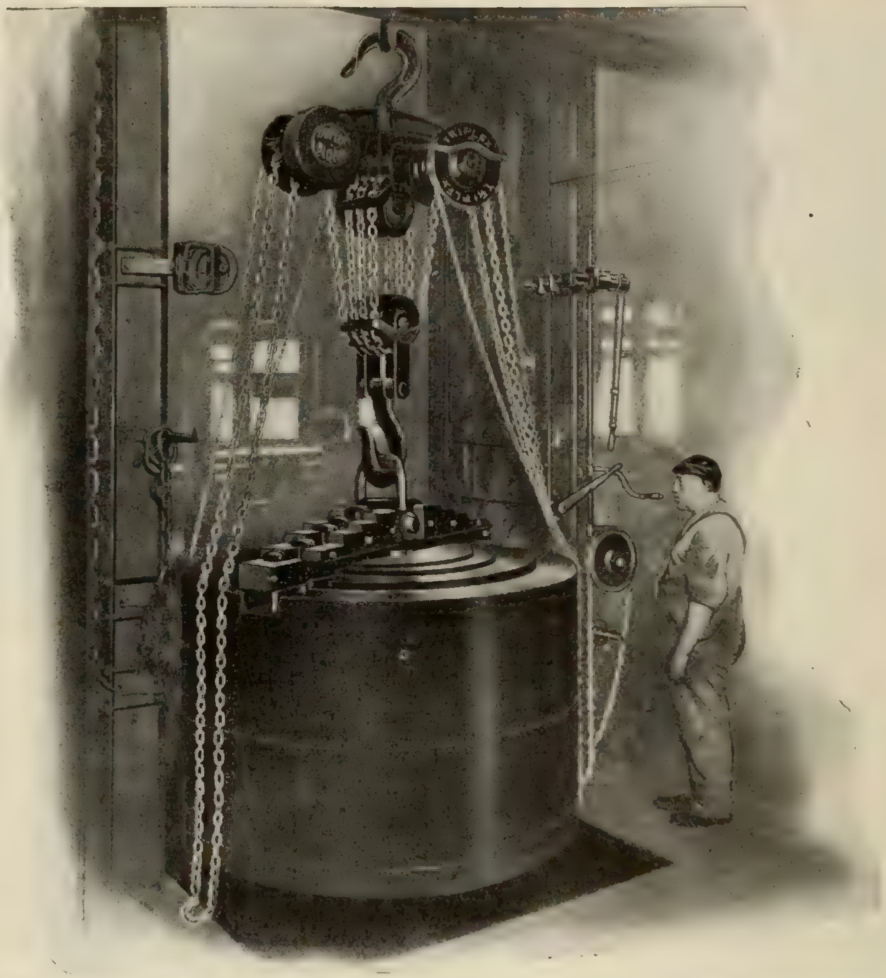
THE TRIPLEX BLOCK



Testing the Safety of each block, by overloading it 50% in long tons in the Yale & Towne factory.

Why the Overload Test is so Important

If a 2-ton load, being lifted by a chain block, should adjust itself in its sling and have a free fall of less than one-quarter of an inch, it will strike the entire block and chain a drop hammer blow of 6,000 lbs., and unless that block has been built, rated and tested for a fifty per cent. overload, an unrevealed defect will cause it to fail and come down with the load. It may crush the life or the limb of the worker. Prevent this harrowing experience. It will surely come with untested chain blocks.

YALE & TOWNE
HOISTS

Unknown defects must cause them to collapse under 6,000 lb. blows.

Triplex Blocks are absolutely safe to the user, for all load bearing parts are steel—steel hooks, steel gears, steel chain, steel load sheave and steel driving pinion. The only chain blocks built in America tested to overloads 50 per cent above rating, to reveal all defects, are the chain blocks built by Yale & Towne.

Send now for your copy of the Book of Hoists. It is an illustrated engineering report of safe handling practice.

EVERY BLOCK TESTED TO 50 PER CENT. OVERLOAD.

TRIPLEX BLOCKS { 16 Sizes: One-quarter of a ton to forty tons.
300 Active Stocks all over the United States and Canada.

Also Duplex Blocks, Differential Blocks and Electric Hoists.

5

and handling the angles. When in a pasty condition, coercion has to be exercised on the work to maintain its relations correctly while the welding is being done. The work may be picked up and handled with the tongs, but it must be laid on a block either during the closing of the weld or during the subsequent setting and correction. Let us take these in turn.

It is necessary to have a block of cast-iron for finishing angle frames upon. A block suitable is shown in Fig. 18. It is bolted down upon a common levelling-block so that it cannot be shifted while the work is being done with hammer and flatter upon the angle iron. If the block be made to the same size as the inside of the entire angle framing, so much the better, and this should be done when several frames of the same size have to be made, but for one or two rungs only, a block might be selected from stock smaller than the frame, or the ordinary levelling-block itself might be utilized.

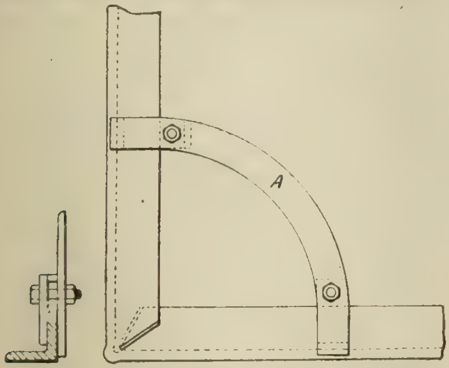

FIG. 21. SECURING ANGLE TO BE WELDED.

For handling and turning over angle-iron, various appliances are used. Thus, an angle is easily held by one end with a pair of specially-shaped tongs used for embracing the outside and the inside of the bar. For turning about at right angles to the length direction, a fork-like tool, Fig. 19 is also used, but when a large frame is partly made, neither of these appliances are suitable. It is too heavy to be handled by hand, its shape is also awkward, therefore, some appliance more or less like Fig. 20 is employed. This is slung by a chain which depends from the forge crane, and sustains the flat-ended bar (A). A clip (B) is bolted to the flat end of the bar, and between the two, the angle-iron frame is pinched. To counter-balance the weight of the frame, a movable weight—indicated at (C), may be pinched with a setscrew in any required position on the bar.

In frames of this kind, it is necessary to maintain the sides in their correct positions while welding and finishing the corners. A suitable method is that shown in Fig. 21. A piece of bar (A) is secured to the flat webs with strips, thickness pieces, and bolts. Such a general method is applicable to any shape, of which Fig. 22 is one example and is self-explanatory.

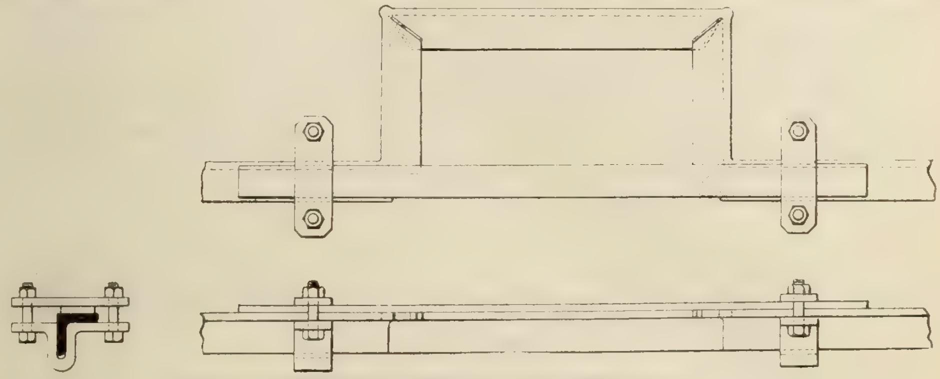

FIG. 22. SECURING ANGLE TO BE WELDED.

When owing to the size of the work or the few pieces required, the cost of setting blocks is not incurred, a good deal can be done on the regular levelling blocks. Fig. 23 is one example of this kind. One block (A) takes charge of an angular interior portion, and a screw block (B) set with a tang in one of the holes of the block is used to impart pressure to the portion to be set.

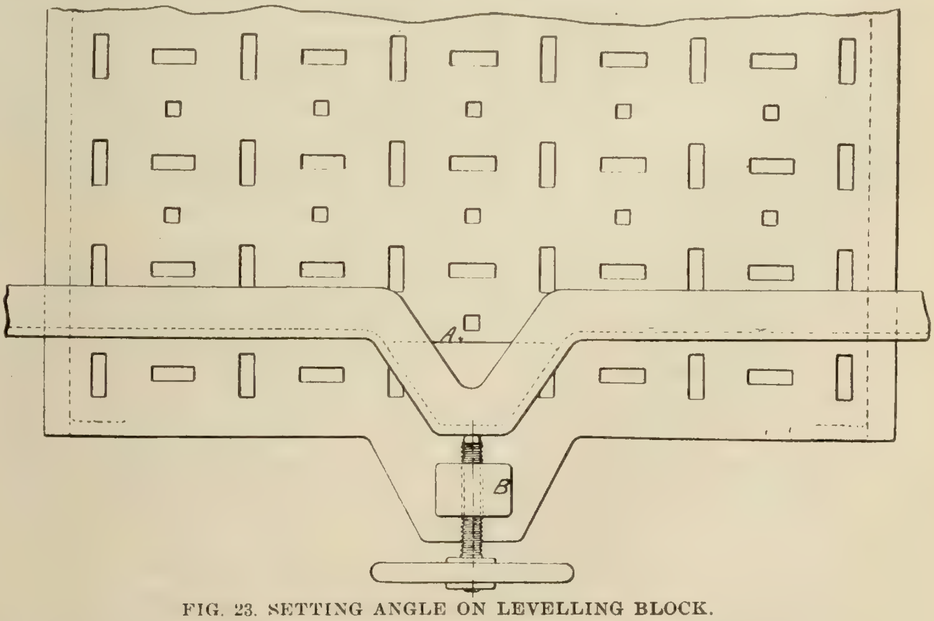

FIG. 23. SETTING ANGLE ON LEVELLING BLOCK.

◆

CANADIAN IRON AND STEEL WORKS.

THE Bureau of Statistics of the American Iron and Steel Institute reports that in 1912 there were in Canada 21 rolling mills and 10 plants which made steel ingots or castings, but not finished forms of rolled iron or steel. Four rolling mills and steel works were idle, one in Quebec and three in Ontario. Six of the rolling mills and steel works active in 1912 are located in Nova Scotia, eight in Quebec, 13 in Ontario, and one each in Alberta, Manitoba, New Brunswick, and British Columbia.

In 1912 four new steel casting plants were built—two in Ontario and two in Quebec. None of these plants is equipped with hot trains or rolls. On December 31, 1912, a plant was being built at Redcliff, in the province of Alberta, for the manufacture of merchant bars.

Blast Furnaces.

Canada had 20 completed blast furnaces on June 30, 1913, of which 13 were in blast and seven were idle. Of the total, 16 furnaces used coke for fuel, and four used charcoal. Two furnaces, one charcoal and one coke, were being built on June 30. In the first half of this year, two plants made ferrosilicon and ferrophosphorus in electric furnaces.

The Dominion Iron & Steel Co., Sydney, N.S., completed a new furnace this year, which was blown in on May 22. It has an annual capacity of 91,250 tons of basic pig iron. Of two blast furnaces being built on June 30, one will be operated by the Canadian Furnace Co., at Port Colborne, Ont. It will have an annual capacity of about 125,000 gross tons. Lake Superior ore and Connellsville coke will be used. It is almost ready to blow in. The Standard Iron Co., Montreal, is building a charcoal furnace at Parry Sound, Ont., its annual capacity being about 36,000 gross tons. It is practically complete. Hematite and magnetite ore from Michigan and Ontario will be used.

The annual capacity of the 20 completed Canadian blast furnaces on June 30, 1913, was 1,391,550 gross tons, and of the two furnaces building was 161,000 tons, a total of 1,552,550 tons. The capacity of the completed coke furnaces was 1,354,750 tons, and the capacity of the completed charcoal furnaces 36,800 tons. The capacity of the coke furnace in process of building was 125,000 tons, and of the uncompleted charcoal furnace 36,000 tons.

Some Lighting Economies in Engineering Works

By Henry S. Whiteley

In many works it is possible to reduce the consumption of electricity for lighting purposes without sacrificing efficiency. The writer here relates a few examples which have come under his notice and may prove of interest to many readers.

IN a modern engineer's erecting shop, having a large bay surrounded by a gallery and served with a travelling crane—the bay, 100 ft. long by 30 ft. wide, was lighted by four 15-amp. open type arc lamps arranged in two groups, two in series per group on 110-volt circuit; the lamps being suspended at a height of 40 ft. so as to clear the crane. The four lamps took 3,300 watts and gave an approximate mean hemispherical candle-power of 5,090, but owing to uneven distribution, they lighted the gallery and crane girders more than the shop floor where it was most needed.

It was decided, therefore, to improve the lighting—and also, what was equally important, to reduce the load on generators, by substituting four of the latest pattern flame arc lamps of the Bremner type, having inclined carbon feed, and using chemical carbons giving a deep yellow light. The new lamps, arranged as before, took 10 amps., or a total of 2,200 watts with an approximate mean hemispherical candle-power of 12,760, and gave an evenly diffused light over the shop floor, besides giving an imaginary sense of warmth due to the color. The saving in watts due to the change was 33½ per cent., or an equivalent of 1.47 h.p., coupled with a gain in candle-power of 250 per cent.

Foundry Example.

In a foundry 60 ft. long by 40 ft. wide, served with a travelling crane, the floor was lighted by means of four open type arc lamps swung on long swivelling arms attached to the rail girders of the crane, so that the latter could pass over, these lamps being also arranged in two groups, one of wihch took 10 amps. at 110 volts., and the other 6 amps., or a total wattage of 1,760, with a mean hemispherical candle-power of 2,710.

The four lamps were replaced by two flame arcs of the type aforenamed, suspended centrally in the bay, but this time placed at a height just sufficient to clear the top of the crane. The total wattage taken was 1,100, with a mean hemispherical candle-power of 6,380, the alteration thus giving a saving of 37½ per cent. in watts or an equivalent of .88 h.p. Also, there was half the time saved in carboning, besides the use of moulders' hands torch lamps were no longer required when finishing off a mould.

Metal Filament Lamps.

The advent of the metal filament lamp with its 1.0 to 1.5 watts per candle-power compared with the carbon filament lamp taking 3 to 4 watts per candle-power, has proved a boon to householders and shopkeepers in the reduction of their electricity accounts, but for industrial works, particularly where vibration and the use of counterweight fittings are general, the use of the metal filament lamp has usually proved costly, owing to the heavy renewal bill; but, by careful discrimination, it is quite possible to successfully use these lamps and obtain a long life.

To such an end, it is advisable that where there is the least suspicion of vibration, either constant or intermittent, such as that due to the handling of heavy goods on upper floors, they should be spring suspended, and it is a good policy never to use metal filament lamps on counterweight fittings, or where they are liable to receive rough usage; 90 per cent. of failures of these lamps are due to mechanical troubles only.

Individual Lights.

In dealing with the individual lights necessarily required by the operators of various classes of machinery usually 8 or 16 C.P. lamps of the carbon type are used, according to the class of machine. Here, for prementioned reasons, the metal filament lamp is out of the question; but, in a certain case where an economy was desired, the writer obtained very satisfactory results by the adoption of a lamp which possesses the mechanical strength of the carbon lamp, but taking less watts per candle-power—a lamp having a metallic coated filament whose consumption in a 10 C.P. size = 32 watts, and in a 16 C.P. size = 45 watts.

By the use of the 10 C.P. size in 100 lights for machine operators, where formerly seventy-five 16 C.P. and twenty-five 8 C.P. carbon lamps were in use, a saving of 2,050 watts=2.74 h.p. was obtained; but though the total candle-power was considerably less, the intrinsic brightness of the filament was so much higher compared with the old lamps as to make the machinery appear better lighted.

The use of metal filament lamps in groups of three or four placed at an angle is not advised—again owing to breakage of filament. It will be found that one high candle-power lamp is much more satisfactory than four of low candle-power. These high candle-power lamps, as now made from 100 C.P. upwards, lend themselves very well for lighting small areas. A smith's shop with eight hearths was lighted with twelve 16 C.P. carbon lamps, taking a total of 700 watts. At suitable points three 100 C.P. metal filament lamps were placed, and the twelve 16 C.P. lamps removed. The new wattage was 360, or a saving of nearly 50 per cent. = .45 h.p., with a gain of over one-third in candle-power. Also, there was less attention to fittings, and saving of lamp renewals.

A careful consideration of works lighting may often show places where an improvement can be obtained, and particularly do these remarks apply to some of the older installations.—"The Power User."

◆

NOTES ON THE ART OF MANAGEMENT.

N a recent issue of the "Machine Tool Engineer," the following observations on the above subject appear as a contribution from the pen of an engineer with experience both as a foreman and manager:—

"When articles are made under daywork conditions the rise of cost is not always because the foreman has failed in his duty and become slack in his organization and control. Waster castings or forgings are, in most instances, not found out to be wasters until a certain amount of labor has been expended upon them, especially in castings where blow-holes come to light only after the outer skin has been broken. Then, there

Observations on Bending and Welding Rolled Sections--II.

By Joseph Horner

The writer of this article, perhaps more than any others who have contributed to the editorial columns of the world's leading technical journals, is a recognized authority on workshop practice, whether the latter be the drafting room, pattern shop, foundry, machine shop or millwright section feature; and readers of "Canadian Machinery" engaged or interested in either of these branches of the mechanical engineering industry will find the regular occurrence and variety of subjects herein treated, helpful and instructive.

IN this article, we deal with the case of sections which are bent at acute angles, and which entail welding at each bending.

Taking first a plain rectangular frame, Figs. 11 and 12, such as form the distance-piece or diaphragms of box girders, these are made of a single length of iron or steel bent round and united by welding. It is obvious that there will be no special difficulty in bending the vertical corners—those corners (A) of the angle that stand at a right angle with the plane in which the bending takes place, but the corners (B) that lie in the plane of bending cannot be bent without causing them to crumple and pucker up. Thus, in Fig. 13, which represents above the length of straight bar, the portion (B) is metal which has to be got rid of before the angle can be bent round to 90 degs. It cannot be squeezed bodily into the metal on either side, it can only pucker up, and no amount of setting down with a flatter would make a decent job of it. This excess must, therefore, be cut right out as shown, before the iron can be bent. Only sufficient metal is left to form a scarf joint for welding, and a little excess for flatting over for the purpose of neat finish as shown in the lower part of Fig. 3. Fig. 14 shows how the same method is applied to the frame in Fig. 12.

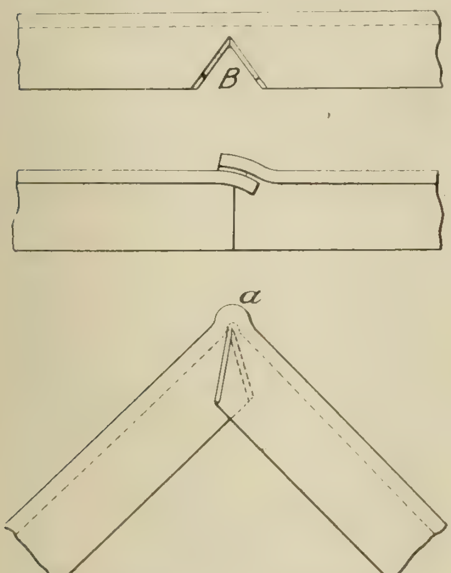

FIG. 13—CORNER AT RIGHT ANGLES.

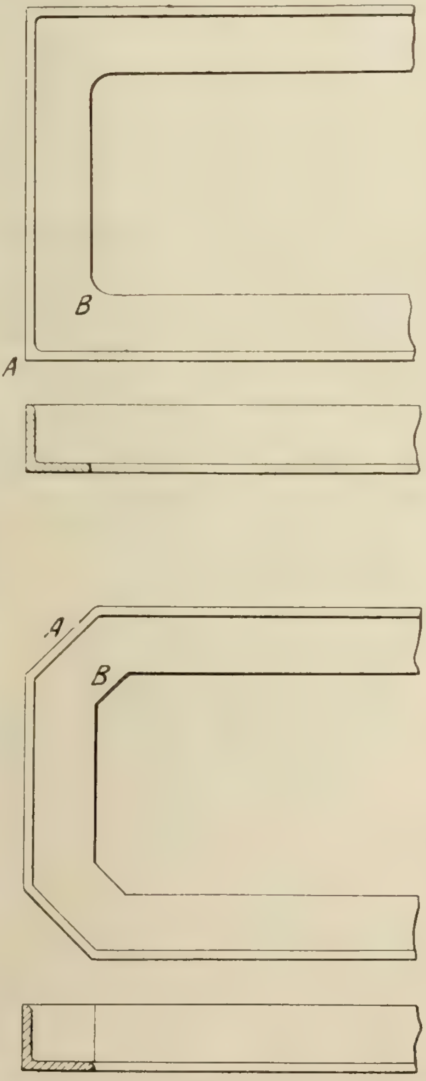
There are, however, other ways in which the corners of these frames of angle section are treated. One is shown in Fig. 15. Here a smaller portion is cut out, leaving a lip (A) projecting to form a lap weld over (B), after the angle has been bent round. The open spaces left are filled up with burrs or punchings welded in Fig. 16. There, it is seen when the lip (A) is turned over and welded on (B), that although a small section might not be left destitute of metal, and the metal should come into actual contact, yet its section or thickness would not be equal in amount to the rest of the iron. In any case, therefore, one or two burrs or discs from the punching machine are welded in these corners, to bring up the metal to uniform thickness. After the welding is done, the surfaces are finished neatly by trimming off with the chisel and smoothing with the flatter.



FIGS. 11 AND 12. FRAMES TO BE MADE.

An external angle, Fig. 17, is treated like Fig. 13, but there can be no lap joint made in this case. One vee may be cut out, or two as shown, and the weld is made by a glut—a piece of plate (A). Just at this stage it is well to note sundry matters which are necessary to success.

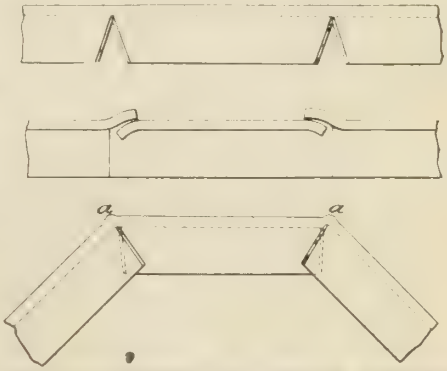


FIG. 14. CORNERS AT OBTUSE ANGLES.

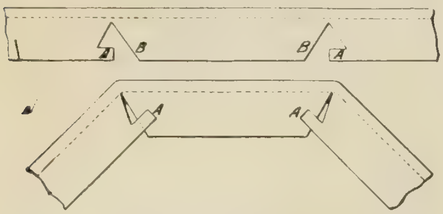
Essentials to Success.

In the first place, the edges left by the vee cut out from the flat of the iron in Figs. 13 and 14 are cut with the chisel at an angle, so as to be well scarfed. This method is adopted when practicable in all welds, whether in common bars, in angles, or in plated work. It enables a better joint to be produced than could be made if the edges were left square. Another point is that the edges are not only scarfed, but are also very slightly fullered up or thickened. This leaves a trifle of metal to be smoothed down with the flatter after welding. Without this slight previous thickening with the fullering tool, the metal would leave the flatter rather thinner at the weld than elsewhere. This also is a practice adopted in making all welded joints.

We next observe that the iron is fullered at the part of the vertical web which has to be bent, and before the bending is done at (A) Figs. 13 and 14. If this precaution be not taken, the effect of bending is to form and leave a radius at the corner, instead of the keen angle required in Figs. 11 and 12. The edge is fullered, if done by hand, thus:

Two round bars are placed across the anvil, the iron, made red-hot is laid upon these, and the fuller is struck with a sledge over the space supported between the bars. For each corner of the frame, excepting the last, the process is repeated and usually before any welding is done. The heating of the corner to be welded is done in the centre of a clear coke fire, or preferably in a hollow space enclosed and covered over with bricks in a fire, or in a small reverberatory furnace, depending on the practice of the shop. The method of welding is as follows:



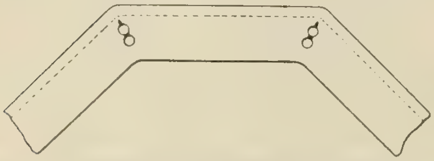


FIG. 15. (UPPER)—CORNERS AT OBTUSE ANGLES.
FIG. 16. BURRS WELDED IN CORNERS AT OBTUSE ANGLES.

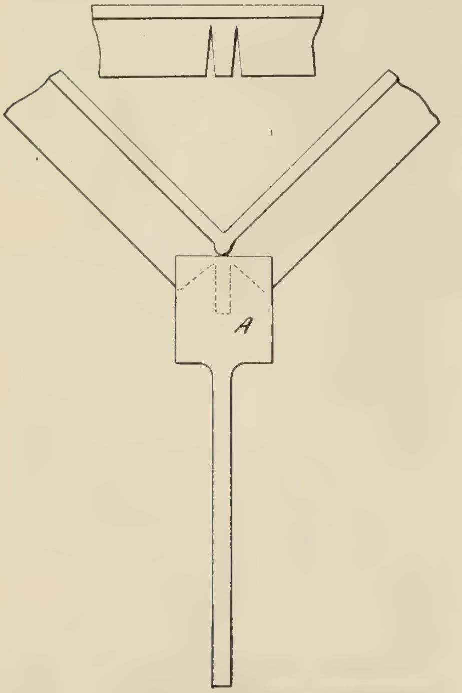

FIG. 17—GLUT WELDING EXTERIOR ANGLE.

Method of Welding.

A piece of plate, the glut (A) Fig. 17, sufficiently large to well cover and overlap the portion removed is cut off, and a porter, consisting of a bit of bar is welded to it. This piece of plate should be heated for welding in a fire separate from the angle. It is easier to get the heat of each right in this way, than if they are heated alongside of one another in the same forge; for it is not sufficient to merely place angle iron in the midst of a clear fire as a smith would a piece of common bar.

The coke used for fuel must not be allowed to come into contact with the face to be welded when it is at a welding heat. If it does, particles of it would sink into the iron or steel and produce holes. A hollow chamber, a kind of miniature reverberatory furnace, is therefore built around the angle-iron in a forge fire as follows: The fire is made up, and the blast put on until it becomes thoroughly hot. Then the angle iron is laid in it, and coke is piled round those parts that have not to be welded. Over the portion that has to be welded, a fire-brick is laid, supported clear of the face, and if necessary more than one brick is used. The brick is partially enclosed with coke, and the blast put on. The brick soon becomes white hot, and throws sufficient heat down upon the angle-iron to raise it to the welding heat.

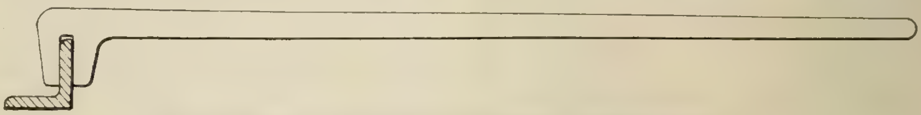

FIG. 19. APPLIANCE FOR GRIPPING ANGLE IRON.

From time to time the smith moves aside a portion of the surrounding coke and tries the surface to be welded with the point of the poker. When he judges by the sense of touch that the metal is soft enough for welding, he signals to his mate at the next fire, and if the glut is also ready, both are removed at the same instant, and brought to the anvil to be welded.

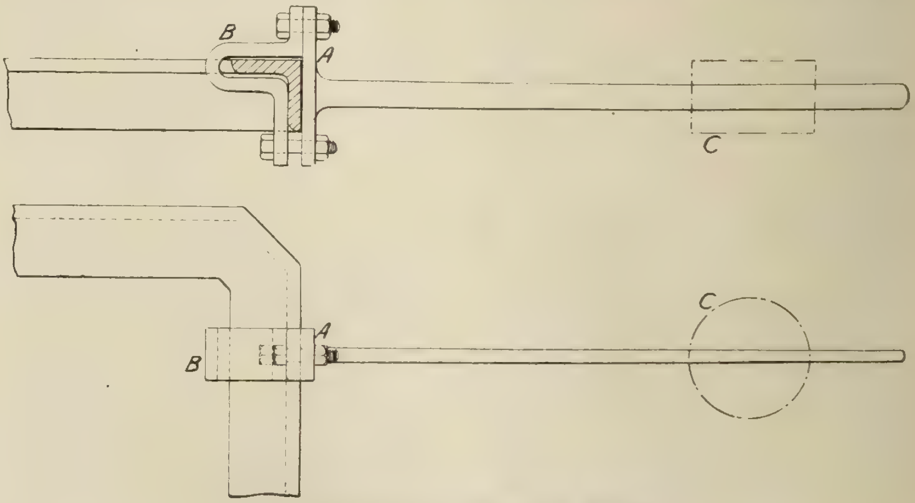

FIG. 20. METHOD OF HOLDING WORK.

A very few blows suffice to make the actual weld, but two or three successive heats are required to finish off a corner completely. The surfaces of the weld have to be levelled with a flatter, and the outsides have to be gone over with a flatter on both inside and outside. Where the flat piece has been welded in, there is a projecting portion that has to be cut and trimmed off with a hot sett neatly. This work is a matter of detail which will occupy less or more time according to the skill or otherwise of the smith, but two or three heats will be a fair average.

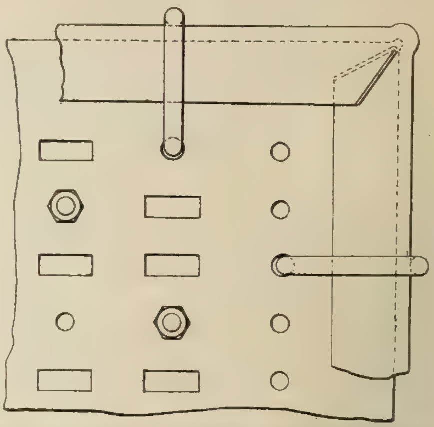

FIG. 18. WORK SECURED FOR WELDING.

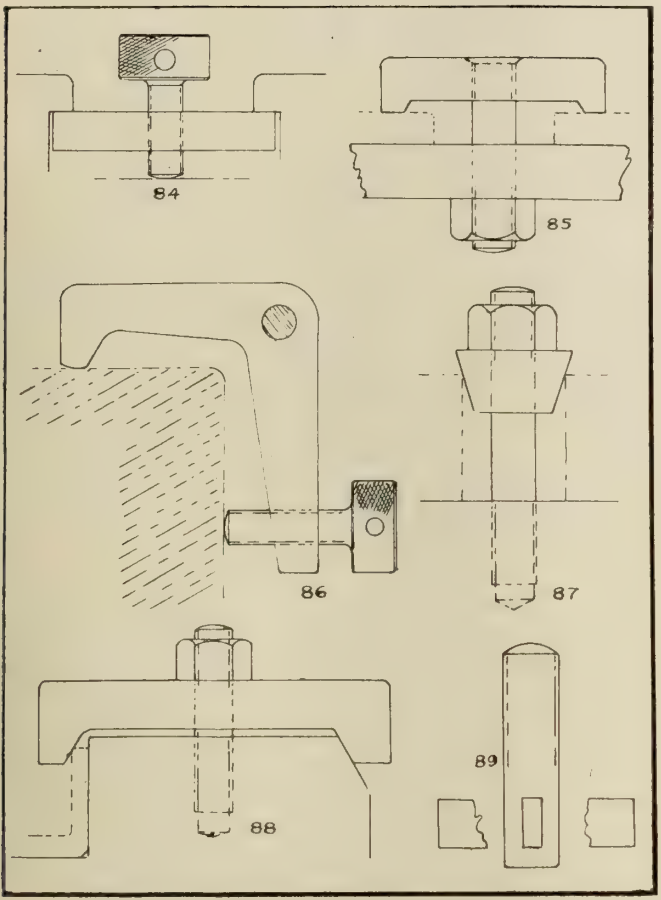
It is tedious and troublesome work, for it must be remembered that strict accuracy is necessary, and the work while in progress is constantly being tested both upon the levelling block for the face, and with a square for the edges. A good deal of setting over with hammer and flatter is sometimes necessary, and this has to be repeated at every corner.

Holding and Handling

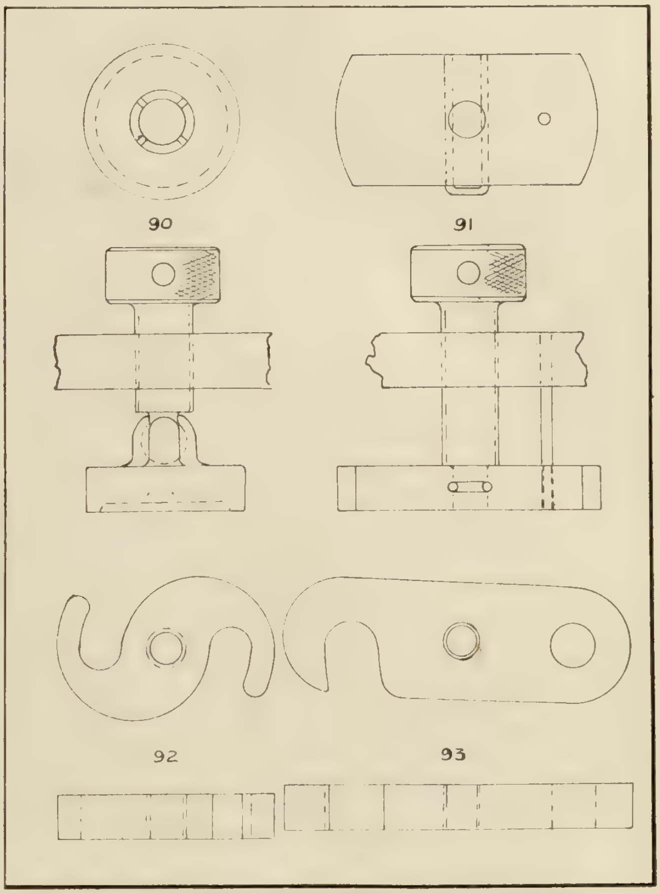
Provision has to be made for holding

Fig. 81 is a finger clamp, but with the end not reduced, as in Fig 74.

Fig. 82 shows a washer made of cast iron, of which many are used in some shops.



CLAMPING METHODS AND DEVICES.



CLAMPING METHODS AND DEVICES.

In Fig. 83 is shown a clamping set screw. It will be clearly seen that the end is burred over, being a wise provision to prevent the loss of set screws, etc. If this be not done, very often a man wastes a lot of time looking for a set screw that is short from the jig he is about to operate with. By burring over, the screws cannot be lost or taken away for other purposes.

Fig. 84 is a good way of clamping, for by simply loosing the screw from the work the clamp can be drawn away from the jig, and the work easily released from the jig.

Fig. 85 shows a clamp for pulling down on to the work. The nut being at the bottom there are no projections above the work. This is especially adapted for milling machine operations.

Fig. 86 is a good way of holding a component, holding the work from two sides. The lever is pivoted, and by screwing the screw inwards it applies the pressure on to the casting or work in two places. It is also well adapted for work in close places.

Fig. 87 is a taper clamping attachment. This, of course, can be made any size, and acts equally well. It can be readily seen that this arrangement not only locates the work for squareness, but pulls down on to the work in addition. It is very useful for adoption with a revolvable where the work can be loaded at one end while the milling cutters are at work on the other side.

Fig. 88 is a useful clamping device, and from the illustration it will be seen that by screwing down the nut on to the clamp the latter presses down the work as well as pulling it back to a face. This is adaptable for milling jig work as well as for drilling.

Fig. 89 is a slotted stud, useful in many ways for clamping work, etc.

Fig. 90 is what is termed a floating clamp for irregular faces. The screw has turned on the end a ball which fits into a cage on the strap. This strap is turned into a disc, with a boss projection formed and drilled to suit the diameter of the ball, being afterwards sawn in four places as shown. The screw, after being fitted into its screwing strap, is put into the formed projection, and the lips are afterwards peened over. It makes a very good and simple ball joint which will line up to any irregular casting.

Fig. 91 is another good clamp. This is pressed down by the screw working in a portion of the jig. The end of this screw is turned with a groove around same. Two holes are drilled into the strap in which the screw has to work. A (U) piece is then knocked into these holes which conform with the recess or groove in the screw. The strap is held from turning with the screw by the pin set in the strap, which slides up and down in the part of the jig, as the screw is worked.

Fig. 92 is a strap working in conjunction with two pins which have heads turned on them. By this method the strap can be swung about its centre.

Fig. 93 is a swing strap, which is swung in position on a fulcrum after the operating screw has been released, and affords the saving of considerable time.

TREATING FOUNDRY SAND.

FOUNDRYMEN will be interested in the experiments that have recently been conducted at Detroit. A complete plant for treating foundry sand either by dry or wet process, for rebonding old sand for use as moulding sand, and for the treatment of new sand to increase its value, is to be erected in the laboratory of the H. M. Lane Co., Detroit. It will have a capacity of about 15 tons of sand per day. It is stated that preliminary tests seem to indicate that 70 per cent. of the old sand now being carried to the dump can be recovered and re-used.

CANADIAN NATIONAL EXHIBITION MACHINERY HALL.

TORONTO Exhibition has appropriated the word "National," and to all and sundry this conglomeracity in the whole Dominion that is able to assume and Canadian National Exhibition. Moreover, there is no show in the whole Dominion that is able to assume and carry this title with such dignity as Toronto. The show is now witnessed by over a million people annually from every corner of Canada and the United States. It is patronised by Royalty and the aristocracy, and the greatest men in the Empire consider it an honour to be invited to its yearly inauguration.

By attaching the word "National" to the title, the exhibits themselves assume a National character, and in every building but one, they do so grandly. It is, perhaps, the most important of them all, the basis of all the others, that is housed in an inadequate, dirty, dangerous, disreputable building. Reference is made to the Machinery Hall, of which the directors have become ashamed. There is a well-grounded rumor afloat that before the next C. N. Exhibition opens its gates, another Machinery Hall will have taken the place of the present frame building, and it is unnecessary to say that the quality of the machinery exhibits will have improved commensurately.

It is not intended here to say anything disparaging about the firms who have valiantly done the best they could this year, and other years, under the circumstances. Some declare that never before has there been such a varied and excellent show of machinery as was packed into the Machinery Hall this year. On the other hand, Mr. Booth, Chairman of the Executive, who is also treasurer of the Canadian Manufacturers' Association, recalled to the writer the days when the largest manufacturers of machine tools in Canada vied with each other in their efforts to put up the best show of tools. They are gone, tired of the endeavour to show modern tools to advantage in such a building, with such appliances.

Mr. William Inglis, managing director of the John Inglis Co., Toronto, who is chairman of the Machinery Hall section, and has charge of the placing of exhibits in that building, has been requested to prepare drawings for a suggested new Machinery Hall, which will be considered by the Executive at their next meeting, and their recommendations will be passed on to the directors. This does not mean that it has been definitely decided to construct a new hall, but it is a step in that direction. The Executive are divided whether to build an Art Building or a Machinery Hall first. The director of the former insists that the space at his disposal is not adequate enough to enable him to display his pictures effectively, and that it will be impossible to exhibit another year in the present building. It is a fact, however, that although technically the directors are required to obtain the permission of the Toronto ratepayers before constructing new buildings, yet they have enough money and the power to go ahead with the construction of both a new Art Building and a new Machinery Hall.

Mr. Percy Rogers, chief clerk of the Exhibition, speaking to a representative of "Canadian Machinery," in the absence of Dr. Orr, the secretary, said that of all the exhibits he thought machinery took first place in importance. They quite realised the inadequacy of the present Machinery Hall. A new building should be erected at the earliest possible moment, as the exhibits in other buildings were expanding so rapidly they could not longer harbor machinery which should be in the Machinery Hall.

are wasters due to the workman's neglect or to some accident to his machine. The best of men are neglectful at times. and in day-work the cost comes upon the firm. In piecework it is the general rule for the workman to replace his labor free. If the waster is due to accident it is only fair that the firm should stand the loss."

Overtime and Piecework.

"Then, there are the overtime extra changes. These in common fairness to the foreman should not be considered when comparing the cost of the same articles manufactured at different times, as this is a thing out of his control altogether. the fact of orders coming in faster than they can be completed being mostly the cause of overtime having to be worked. The primary idea was to get a more even cost and enable a correct estimate to be given before the work was put in hand, but even in shops where piecework is the prevailing system, the costs fluctuate nearly as much as they do in a shop where day-work is the rule.

The causes enumerated above are sometimes responsible for this, but there are others which creep in under the piecework system. In many cases when it is decided to institute piecework in a firm which has worked day-work, the previous costs are taken as a basis and prices fixed on those. This is invariably done by one of the cost-office staff, who, above everything else, is a clerk and not a practical engineer, whatever his position in the cost office may be, and nobody can expect him to be able to form an opinion in regard to the cost of an article—still less to fix a fair cost — therefore, he can only strike an average if the article has been manufactured at various times, or accept the cost as shown in the books, if it has only been made once before. These costs are invariably wrong as regards actual labor costs, as they may be and are in many cases inflated by the causes mentioned before—wasters, overtime, etc. — which are not usually shown in detail, especially in the older forms of cost keeping."

The Rate Fixer.

"When a firm adopt this way of instituting piece-work, the prices are usually fixed by a rate fixer in the cost office, who, as I said before, is in most cases not a practical man, and sent down to the various departments, the foremen, on whom, by the way, rests all the responsibility of the costs in their departments, having nothing whatever to do with the prices given, whether they are high, fair, or low. Now, in my opinion —and I speak from experience both as a foreman and manager—it is far better if it is decided to have the prices fixed in this way, to have a rate fixer for each department, who, above everything else, must be an authority on the manufacture in the department in which he is placed, as no one man can be an authority on every department. Another, and by far a better way is for the foreman to fix the prices for his own department, as, of course, he is responsible for the cost as well as for the general organization of the shop, and there will be a better feeling in the shop, as the men will know that the foreman is prepared to uphold his price by demonstrating or explaining how the article can be made for the price."

Night Shifts and Changes.

"When the work is too great to be dealt with in the ordinary day hours, with perhaps two or three hours overtime, a night shift is started. If a day-work shop, the actual labor cost per article rises. No matter how good the extra workmen may be, strangers can never complete as much work in equal hours as the men who are used to the shop conditions, and this holds good for some time. If the shop is worked on a piecework system there is less chance of the actual cost rising, as both the day and night man enter their time in the same piece book, the balance made being shared according to the hours each works on the job.

Again, a man may be leaving who has, by working a certain machine a number of years, got the full output from it. The man who replaces him, though a good man, may run a few jobs into debt, thereby raising the cost. This can be provided for to a certain extent by the foreman having another man in the shop, who is perhaps working a similar machine but smaller, ready to replace such by putting him on the larger machine when the man is breaking time."

Allowance for Variable Elements.

"If the cost office would institute a system, by having a few more columns in their books, whereby they could see at a glance actual time taken, extra time for overtime, time replacing waster, cause of waster, piece price, balance, if any, it would facilitate estimating considerably, give the reason for the extra cost, if any, and incidentally save many an argument between the manager and foreman. The only time when the foreman ought to be asked to explain the extra cost would be when all the columns were empty excepting the piece price and time taken, the time taken showing a larger cost than the price given, as that would show the price was too low, or, providing a balance had been made on the same job before, the workman was not competent.

Providing this system was worked up to and records were sent out to the foremen directly, a cost was found to be going up, it would help them considerably, they would be able to give a more satisfactory reason on account of the job being fresh in their mind, and be helped to keep a better supervision of their costs."

AMERICAN PATENT SYSTEM.

THE relation of letters patent to modern industrial conditions formed the subject of an address by Mr. F. P. Fish, of Massachusetts, at the meeting of the section of patent trade mark and copyright law of the recent American Bar Convention at Montreal. The speaker described the patent system in America as the best in the world and absolutely necessary for the industrial prosperity and growth of the country. Today, he affirmed, patent systems are of more value than ever. No other form of reward was offered, and this has been decided practically unanimously to be the most fitting.

Under the American system, the men who produce inventions receive their reward only when they have invented something that the public wants, but through the history of invention the failures have stood out very conspicuously. It is not even every good idea that pays. Sometimes it may be too soon. The act of invention is only a step towards bringing profit to the inventor, and very few inventors have the ability to put their ideas in a commercial form. Our patent system, the best in the world, is absolutely necessary for the development and growth of our country, and that growth does not come without stimulus. The patent system provides that stimulus.

PATENT REPORT.

THE following patents were recently secured through the agency of Marion & Marion, Patent Attorneys, Montreal, Canada, and Washington, D.C.:—

Nos.

149,777—Harry K. Pell, Nordin, N.B. Wagon gear.

149,829—Julius Dorneth, Berlin, Germany. Typeline casting machine.

150,101—Joseph Carreau, Montreal, Que. Skin and hair tonic.

150,116—Charles C. Freeman, Day Dawn, W. Australia. Grinding pan discharge and classifier.

150,141—Arsene Riopel, St. Elie de Caxton, Que. Rowlock.

Drill Jig and Fixture Design and Construction

By H. R.

The sketches and data will, the writer hopes, appeal to machine shop superintendents, designers, toolmakers, and novices, as indicating the large place jigs of every kind and for every service occupy to-day in machine shop practice. The present article is the fourth of a series.

THIS article, and the next few, will deal fully with all kinds of clamping methods and devices, and perhaps it would be as well to remind the reader of the importance of suitably clamping the work, so as not to distort either the component or the jig. On the other hand, the work will have to be extremely rigid. This will be better explained by the following table, which shows the great amount of pressure required for drilling cast iron:—

Drill Diam.	Max. pressure on drill while drilling.	Max. pressure on drill while drilling with full diam. of drill.
¼ in..	300-350 lbs.	400-500 lbs.
½ ,, ..	700-800 ,,	900-1,000 ,,
¾ ,, ..	800-900 ,,	1,000-1,200 ,,
1 ,, ..	900-1,000 ,,	1,200-1,500 ,,
1¼ ,, ..	1,000-1,100 ,,	1,400-1,800 ,,

Reference to Illustrations.

Fig 69 is the commonest of all clamps, being used in every kind of jig and fixture work. They are also used extensively for clamping down work on milling machines and planers, etc. For drill jig work, it is well that the designer, if possible, saves the operator the trouble of unscrewing the nut right off to get the work out of the jig. This becomes necessary in order that the clamp may be swung out of the way of the work.

In fig. 70, this is not necessary, because the slot enables the strap to be pulled clear of the work, and it will be readily noticed that the turned down portion is made to suit the height of the work to be held. This saves the necessity of having packing pieces.

Fig. 71 is made so as to be adjustable. This is accomplished by the set screw, and the hole can be elongated if found necessary.

Fig. 72 is of the same design as Fig. 70, but has a finger-formed end for getting into close places. It is termed a finger clamp. When the clamping of the work is set up high, Fig. 73 shows a method of holding the clamp always up to the required height. This is done by placing a spring under the clamp, and if clamps of this description do not have a spring under them, they become an encumbrance.

Fig. 74 is a divided clamp used on work with ribs.

Fig. 75 is much used on milling work, but is sometimes equally adapted for the drill jig. The clamp being cranked enables the top of the screwing-down nut to come flush with its top, and not stand above the top of the work.

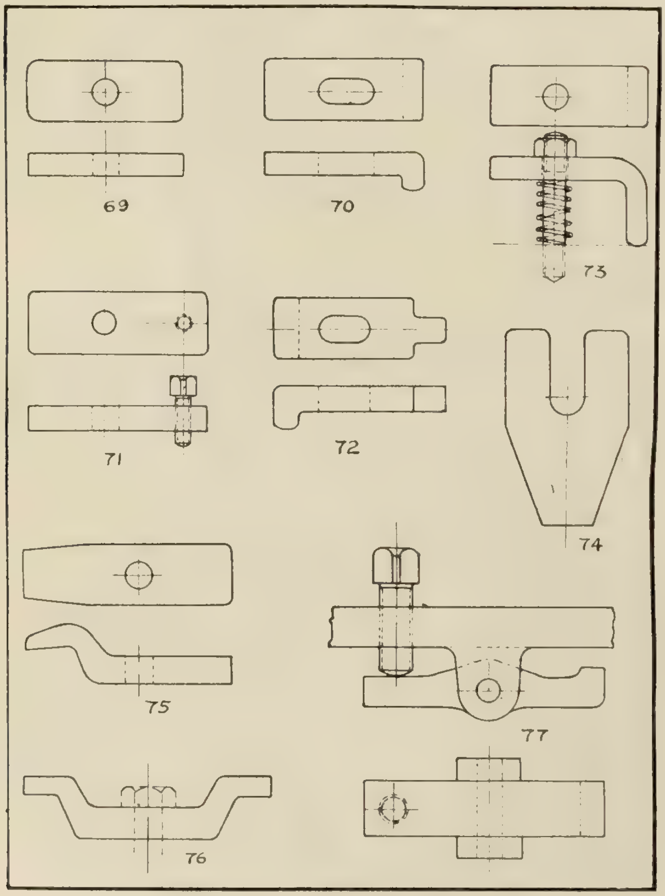
Fig. 76 is a double-ended clamp of the same type as Fig 75.

Fig 77 shows a very suitable and effective way of holding flat plates, although it may be equally as well applied to other purposes. The clamping lever is pivoted, and pressure is applied through a set screw from the top of the jig. This can be also reversed if required by screwing the set screw into the clamp, and pressing on to the casting.

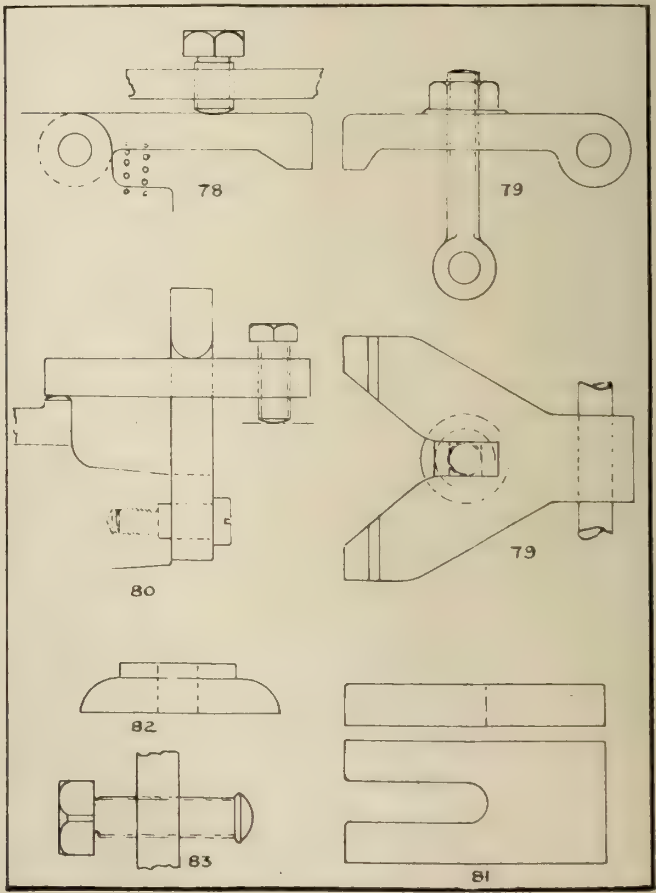
Fig. 78 is a clamping device that may be utilised in close places. The clamp is pivoted, and the pressure is applied through the set screw, and, for convenience, the coiled spring is always holding the clamp up to the set screw, or in other words, prevents the clamp from falling.

Fig 79 is a very useful device. It comprises a swing forked strap, and, as will be readily seen, the screwing-down bolt is also pivoted, enabling the swing strap to be freely swung away without adjusting the nut to any extent.

In Fig. 80, the strap is of the same design as Fig. 71, but is used with a vertical swinging piece. This has a fulcrum which screws into the jig.



CLAMPING METHODS AND DEVICES.



CLAMPING METHODS AND DEVICES.

DEVELOPMENTS IN MACHINERY

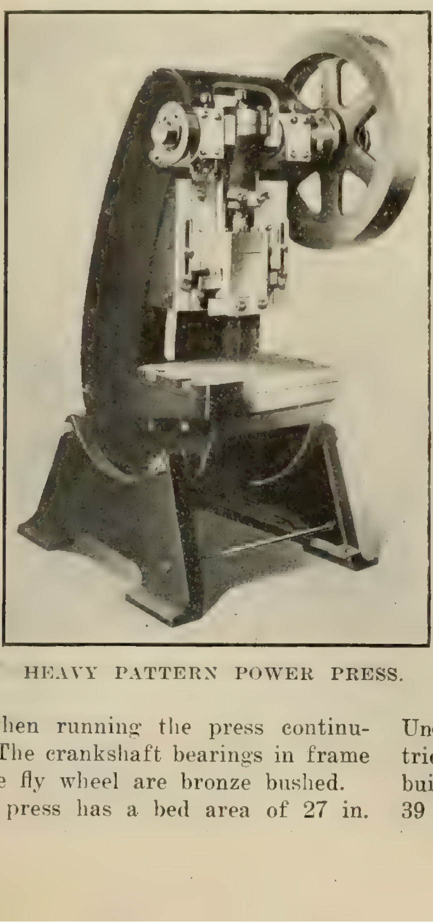
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

SHEET METAL WORKING MACHINERY.

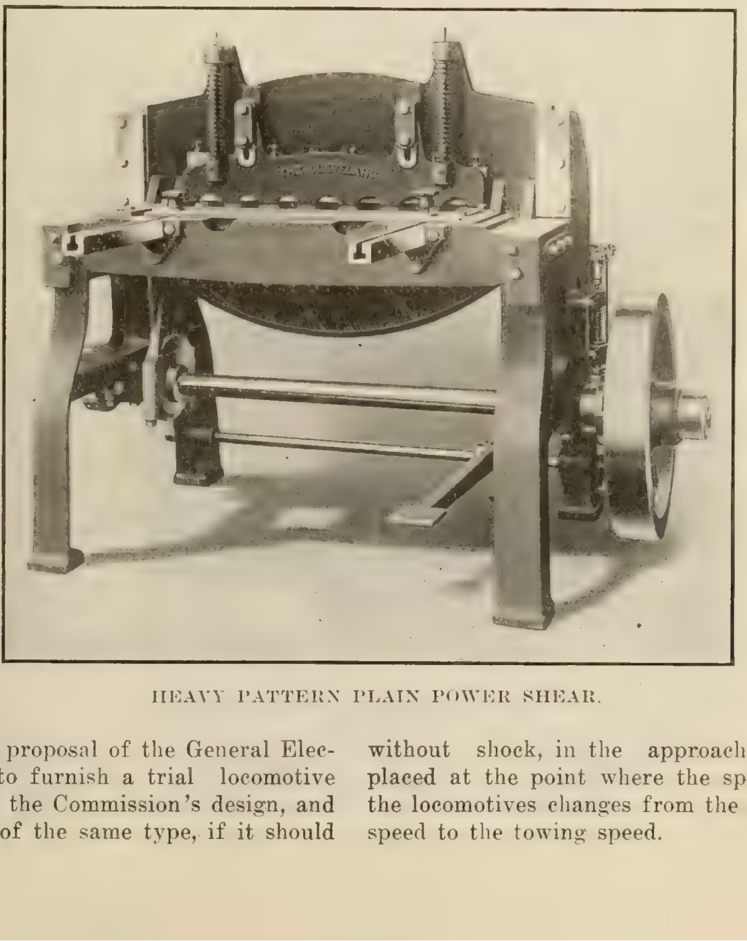
THERE are here shown two new heavy pattern machines for working sheet metal.

Fig. 1 is a power press of the open back inclinable type, and has capacity for exerting a pressure of 60 tons. The inclining device consists of a rack and pinion with worm and worm wheel for multiplying the power applied. One man can easily adjust the press to the inclined or straight position. The clutch pin is mounted in a steel collar forged solid on the shaft, and has a safety latch which automatically locks the pin, and makes it impossible to trip the press with the treadle when shaft is turned down for the purpose of setting dies.

The slide is provided with a knock-out bar, which is operated by two adjustable plates mounted on front of housing on each side of the slide. These plates can be tightened to suit the work in hand, and adjusted to slip under an overload, which would cause some part to break, if adjustment was positive. The brake band is adjusted under the tension of a spring, which automatically compensates for wear and for the expansion due to heat when running the press continuously. The crankshaft bearings in frame and the fly wheel are bronze bushed.



HEAVY PATTERN POWER PRESS.



HEAVY PATTERN PLAIN POWER SHEAR.

This press has a bed area of 27 in. right to left, by 18 in. front to back; distance back from centre of slide, $9\frac{1}{2}$ in.; distance from bed to slide with stroke and adjustment up, 11 in.; thickness of bolster plate, 2 in.; standard stroke of slide, 2 in.; weight of fly wheel, 800 pounds; and total weight of machine, 4,400 pounds.

Plain Power Shear.

Fig. 2 shows a plain power shear with blades 31 in. long, and capacity for cutting No. 18 gauge steel full length. This machine has extra deep sections in bed and gate, and is designed for hard and accurate service. It has the same style of clutch as described for the press. The gate has a powerful spring hold-down, and the machine is furnished with a complete set of front, rear and side gauges. The weight complete is 1,250 pounds. Both machines are built by the Cleveland Machine & Mfg. Co., Cleveland, Ohio.

◆

TEST OF TOWING LOCOMOTIVES.

TESTS of sample double truck towing locomotive, No. 640, conducted at Gatun Locks, demonstrated that the machine is not satisfactory in all respects. Under the proposal of the General Electric Co. to furnish a trial locomotive built from the Commission's design, and 39 others of the same type, if it should prove satisfactory, the Commission reserved the right to change to the alternative single truck design submitted by and bid on by the contractor. Award has now been made for 40 locomotives of the alternative type, with certain modifications, which the recent tests have shown to be desirable.

The principal defects found in the trial machine were, as follows:

1.—The unreliable action of friction intended to prevent the drum from turning until the desired pull had been reached.

2.—The narrowness of the winding face of the slip drum, which has the width of only two diameters of rope, and which, therefore, caused the layers of rope to overlie each other unevenly, and through violent slipping, to injure the rope, as well as prevent the use of as long a line as had been recommended by the naval advisor.

3.—The vibration due to the uneven surface of the rack rail against which the thrust wheels bear, and hold the locomotive to the track under the horizontal pull of the line.

4.—Failure of the pinion to engage without shock, in the approach racks placed at the point where the speed of the locomotives changes from the return speed to the towing speed.

Alternative Type.

Under the award, the contractor will furnish the alternative type of locomotive as originally proposed, inclusive of the following modifications:

1.—Omission of solenoid operating clutches and friction gear.

2.—Addition of hand operating clutches.

3.—Addition of equalized hand brakes.

4.—Fitting springs to thrust guide wheel.

5.—Change in windlass.

The above will make a net addition in the cost of each locomotive of $1,543, allowing for a deduction of $324 for each locomotive for omission of clutches. The total net cost of each machine under the award will be $13,217, or a grand total of $528,680 for the 40 locomotives.

The contractor has promised to make delivery of the first locomotive in seven months from the date of the order, and of the remaining 39, at the rate of four a month.

◆

WORLD'S LARGEST PRECISION TESTING MACHINE.

THE illustrations show views of the testing machine which has recently been installed at the U.S. Bureau of Standards, Washington, D.C. This machine is used for testing columns, blocks, beams, girders, and other shapes of steel, iron, wood, concrete, reinforced concrete, etc., in order to determine the breaking strength, the spring under load, and other valuable engineering data. It is able to take specimens of any length up to 34 feet, and can exert a pull of 1,150,000 lbs., or a crushing force of 2,300,000, and yet so delicate is it that the pressure of the finger upon it will be registered.

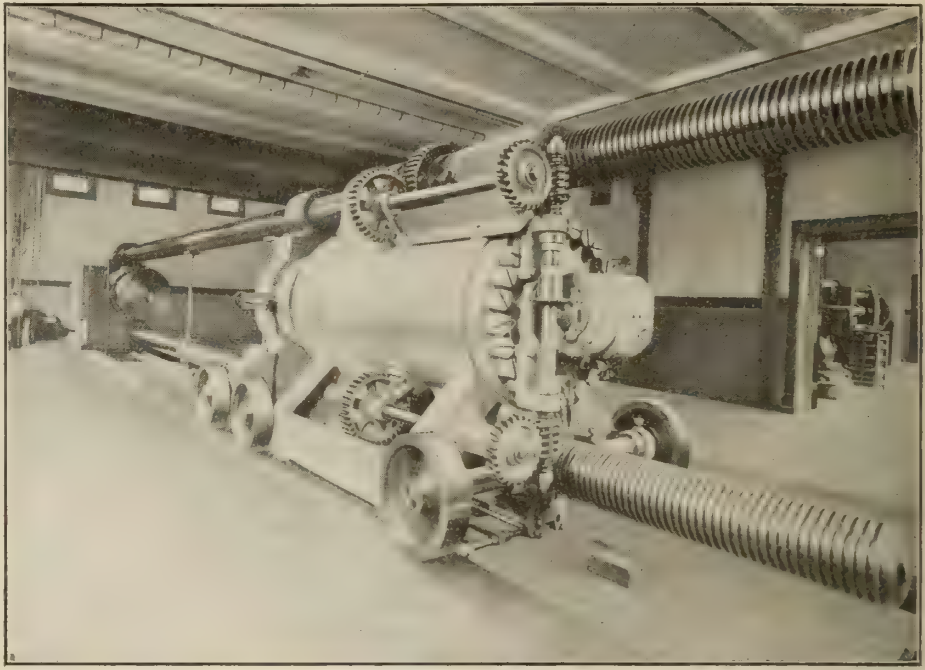


FIG. 1. THE WORLD'S LARGEST PRECISION TESTING MACHINE.

The machine consists of two main parts connected by two enormous screws. One part (Fig. 2, and the remote end of Fig. 1) is stationary, and contains the mechanism by which the force exerted on the specimen is measured. The other part, called the press, is movable, and consists essentially of a hydraulic cylinder mounted on wheels. It will be noted that the head of the hydraulic piston is mounted on wheels of its own, and can move independently of the cylinder. The oil, which is used to produce the hydraulic pressure, is supplied through a pipe, which telescopes or elongates as the press is moved.

In testing, the press is moved to the proper point, depending on the size of the specimen, by the Westinghouse motor seen in the photograph. The specimen is then put in place, being gripped by jaws mounted on each of the ends of the testing machine, if it is to be put under tension, or held between two heavy plates if it is to be compressed. The hydraulic piston is then slowly forced forward or pulled back, depending on whether the test is of compression or tension, until the specimen under test is ruptured.

Fig. 3 shows the Deane pump driven by a 20 h.p. Westinghouse motor, which supplies the oil for operating the hydraulic cylinder. This pump is capable of delivering oil at a pressure of 3,500 lbs. per square inch.

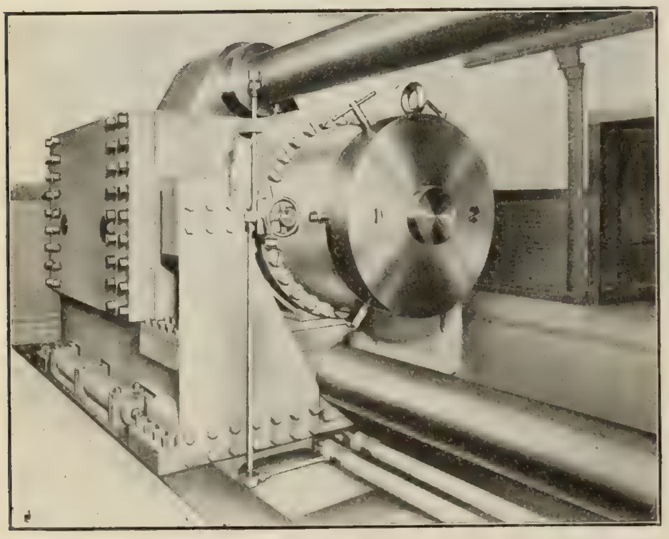

FIG. 2. STATIONARY END OF PRECISION TESTING MACHINE.

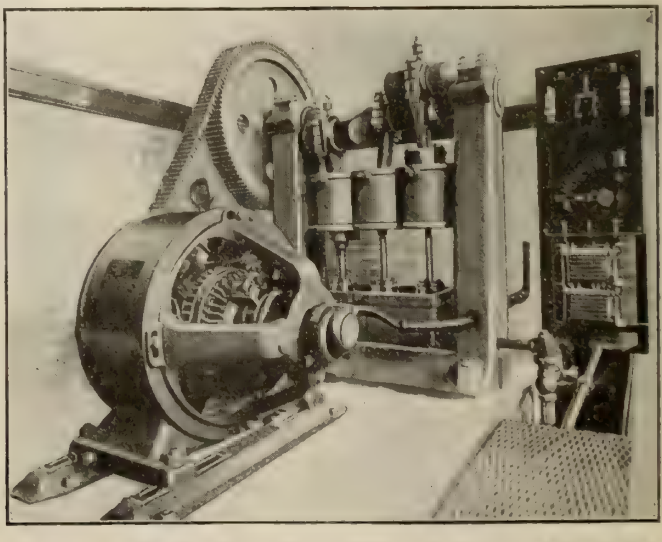

FIG. 3. OIL PUMPS FOR OPERATING HYDRAULIC CYLINDER.

◆

HYDRAULIC FORMING PRESS.

ANOTHER new special hydraulic forming press, designed and built by the Hydraulic Press Mfg. Co., Mount Gilead, Ohio, is shown by the accompanying figure. It is used for forming various shapes from sheet metal or other material requiring a medium pressure.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

A SHAPER PROBLEM.

By J. H. R.

THE accompanying sketch shows a simple, but somewhat interesting, shaper job. Fig. 1 represents the feed shaft of a certain machine, upon which a head travels lengthwise, being advanced at each revolution of the shaft (A), a distance of one-half inch, by the action of the rack (B). It is desired to find the angle of the groove in the rack, and the lateral feed of the shaper table.

While the average mechanic would, no doubt, insert the blank strip, and lay off the desired position of the grooves, a mathematical solution of the question may be of interest to some of the readers, as several of the men in the shop could not see why the grooves in the rack would be spaced different than those in the shaft.

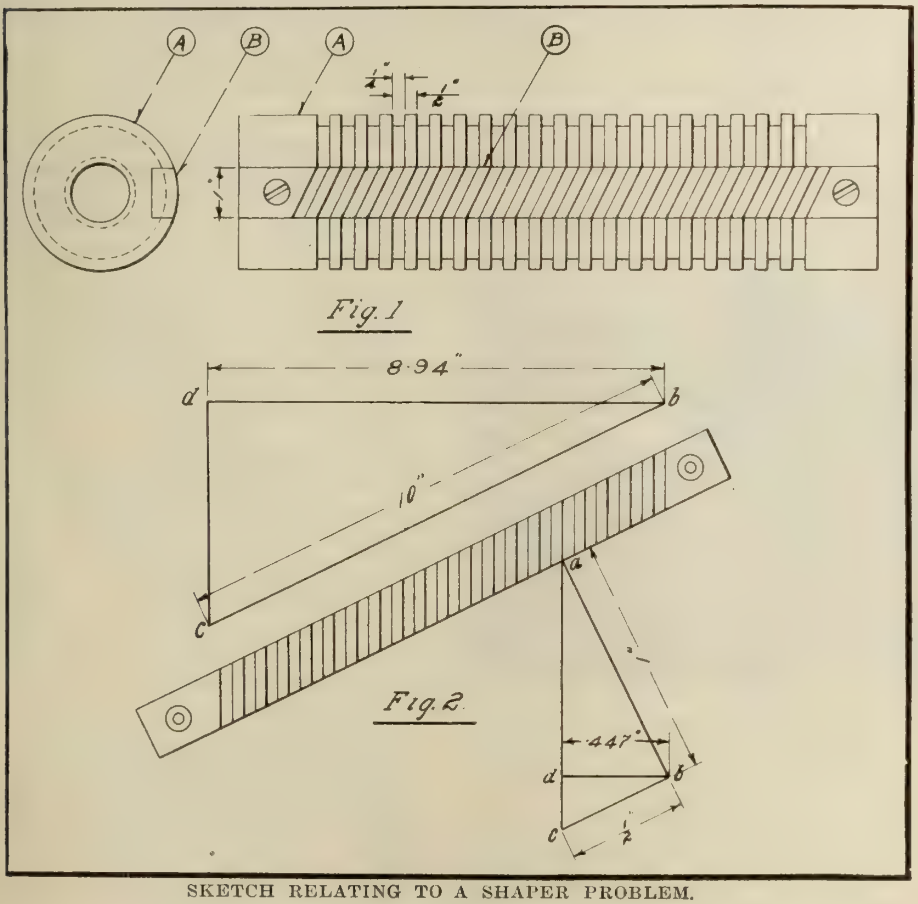
First, to find the angle at which to set the shaper vise. In Fig. 2, the right triangle (abc) is enlarged for clearer demonstration. The length (a-b) represents the width of the rack, and (b-c) the pitch; then by the trigonometric functions we have:—

$$\text{Tangent of angle (a) equals } \frac{\text{side opposite}}{\text{side adjacent}} \text{ equals } \frac{.5}{1} \text{ equals } .50000$$

Angle corresponding equals 26 degs.—34 ft. nearly.

To find the lateral feed of the shaper table, or the distance (b-d), we have:—

Side opposite equals hypotenuse × sine equals 1×.44724 equals .447 inches nearly.



SKETCH RELATING TO A SHAPER PROBLEM.

Total feed for the 20 grooves equals .447×20 equal 8.940 inches nearly.

The groove being 1/4 in. wide, the rib of the rack (B) is somewhat narrower than the rib in the shaft (A).

* * *

WANTED A REASON WHY?

By D. A. Hampson.

IN 1909, the Middlesex Tool Works purchased a sensitive drill press from the Smith Machine Tool Co., for $80. The machine was of the friction drive type, equipped with ball thrust bearings on the spindle, and on the friction driven shaft. It was put to work drilling 3/8 inch holes in machine steel bars, and, as the months rolled by, it continued to do its work quickly and well, its upkeep being nothing more than the time required to occasionally tighten the frictions.

The business increased, and, in 1912, the Middlesex people needed another drill for bar work. Needless to say the Smith Machine Tool Co. got a repeat order, and at their quotation of $92.50 f.o.b.—the difference being explained as due to the increase in price of materials and labor. Machine No. 2 was a duplicate of No. 1, except that a pair of fibre washers had been substituted in each case for the ball bearings to take the thrust of driving. On being interrogated, the Smith people declared this to be a late improvement, and offered every assurance that the second machine would do all that the first would, and possibly a little more.

Several months went by, and No. 2 failed to live up to expectations; only about three-fourths as much work could be turned out from it as from No. 1. Dressings for the frictions were tried, various lubricants used, driving belt was taken up, slip bushing put in a jig or two, but still No. 2 lagged behind. As stated before, the only structural difference between the machines was the thrust bearings. The Smith Co. was asked to send ball bearings for machine No. 2, but replied that they could not supply them.

Resourcefulness Victorious.

Now, the manager of the Middlesex Co., is a resourceful man, and a few weeks later dictated the following letter:—

"Kindly send me at once a full set of ball thrust bearings for the drill press which we purchased in 1909, and which have become badly worn. Yours. etc."

The parcel postman delivered them in three days, and No. 2 was immediately placed on the hospital list for the morning. Off came the offending fiber washers. About 1/8 inch was faced off the end of each quill to make room for the increase in thickness, and on went the ball bearings. Their outside diameter and their bore were both correct.

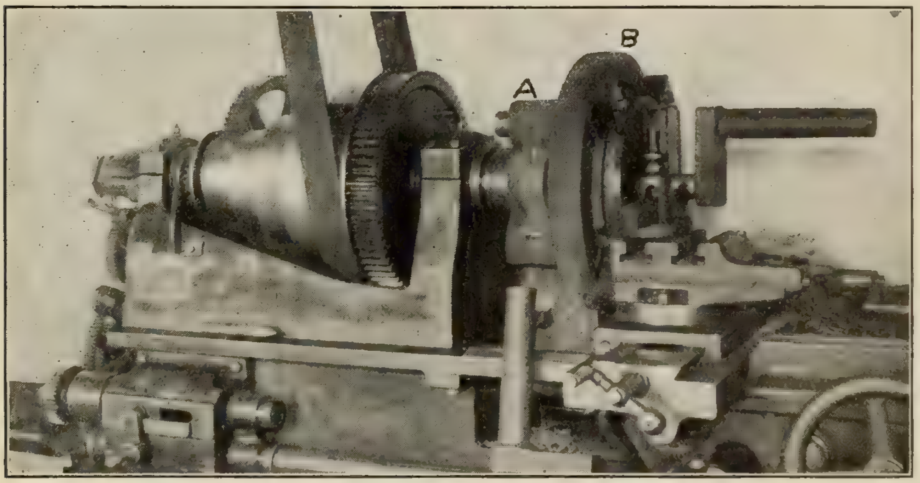
Machine No. 2 now does as much as No. 1, and has done so from the day the change was made. One cannot help wondering why the Smith Co. should retrograde in this day of ball and roller bearings.

* * *

CRANKSHAFT TURNING FIXTURE.

D. O. Barrett.

THE accompanying photo shows a fixture for holding single throw crankshafts such as are used for gasoline engines, while turning. The casting (A) is threaded to screw on the nose of the lathe spindle, being bored out on the one side with a counterweight of the proper dimensions for the shaft to be turned on the other. The end of the casting has a circular disc a little larger than the cheek of the crank, and about one and one-half inches wide. This portion is finished, and runs in the casting (B), which has four rollers. Casting (B) is similar to a steady rest, but it is a single casting. The four rollers are adjusted up against the piece (A) by backing screws, and then locked. By using rollers a ready means of adjustment is provided for any wear; for wear will, of course, eventually occur.



CRANKSHAFT TURNING FIXTURE.

The cranks are first rough turned one-thirty-second of an inch oversize. Piece (A) is split and arranged to clamp the shaft. It also has two posts carrying adjusting screws, which bear against the shaft at the centre, and will hold same against the heaviest cuts. The arrangement has proved to be ideal for this class of work, and cut down the time required to do these shafts by about one-third.

* * *

TESTING ELECTRIC MOTOR DRIVES.

By John Green.

ELECTRIC motors are beyond all doubt the best, cheapest and most convenient prime movers for woodworking machinery, and the direct-connected induction electric motor leaves little to be desired for driving woodworking machines.

The Overloading Feature

There is, however, another side to the electric motor story—a side which is sometimes neglected to the great delay of the shop, and sometimes such neglect causes costly repairs. The matter to be looked after is the overloading of motor drives. Electric motors are so designed that they will safely handle momentary and frequent overloads of 50 to 60 per cent. of their rated capacity, but that does not mean that a motor will safely carry such an overload all the time.

Overloading a direct-connected motor renders itself visible by sparking between brushes and commutator. When sparking is observed, which will not vanish by carefully adjusting the brushes and cleaning the commutator, then it is time to determine if the motor is working above its rated capacity.

Delivered Power Test.

Testing the power actually delivered by a motor is a very simple matter and very easily performed. All that is necessary is to connect into the circuit a voltmeter and an ammeter and take simultaneous reading from both instruments when the load is on the motor. The load may be roughly determined by using an ammeter alone and depending upon the nominal voltage of the line for the E. M. F. present when the ampere flow is determined.

A still better method of determining the power delivered by an electric motor is to cut into the circuit a recording watt-meter, which continuously records upon a revolving disk of paper the amount of work being performed by the motor under test. By drawing upon the disk circles representing horsepower, the observer can see at a glance the exact power delivered by the motor at each and any minute, while the watt-meter is thus connected up.

With the ammeter alone to determine the power, say 20 amperes were shown to be passing through the motor, simply multiply the number of amperes by the line voltage, and divide by 746. Should the line voltage be 220, then the watts consumed equals $20\times220=4400$, and $4400\div746=5.9$ horsepower nearly. Thus, should the test show 20 amperes to be passing through a 5 horsepower-motor, the machine is overloaded, and should be looked after.—Woodcraft.

FOUNDRYMEN'S CONVENTION PROGRAMME.

THE general committee in charge of arrangements for the Convention of Allied Foundrymen's Associations at Chicago in October is rapidly completing its plans, and the preliminary announcement of the programme of Convention Sessions and Entertainment has been made as follows:

Monday, October 13.

Registration.

Tuesday, October 14.

Morning: Joint session of American Foundrymen's Association and American Institute of Metals.

Address of welcome by the Mayor.

Responses.

Reading of general papers.

Afternoon: First professional session of American Foundrymen's Association.

First professional session of American Institute of Metals.

Wednesday, October 15.

Morning: Professional session, American Foundrymen's Association.

Professional session, American Institute of Metals.

Annual meeting, Associated Foundry Foremen.

Afternoon: Special North-Western Elevated train to Bismarck Garden from North Water Street terminal.

Thursday, October 16.

Morning: Professional sessions.

Afternoon: Professional sessions.

Evening: Annual banquet at La Salle Hotel.

The ladies' entertainment programme will include a luncheon at Marshall Field & Co.'s, Wednesday noon, and in the afternoon a matinee performance. On Thursday evening the ladies will be entertained at the theatre.

Arrangements are being made with a large number of plants in and around Chicago so that members of the Foundrymen's Associations may secure passes at the Convention Headquarters to inspect these plants either individually or in groups. The Hotel La Salle, Madison Street, is to be the general headquarters for the Convention.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada
To Achieve and Maintain a Dominant Place in the Markets of the World.

BRITISH MANUFACTURERS SHOW TRAIN.

WORD has been received at C.P.R. headquarters that it is the intention of the Canadian Chamber of Commerce in London to emulate the example of the Canadian manufacturers, and run a train through Canada which will be loaded with English manufactured products. The excellent success which this venture met with in Canada on behalf of the Canadian manufacturers has led to this move by their English brethren.

CANADA'S TRADE WITH UNITED STATES.

THE United States ranks first as a caterer to Canada's needs and second as a customer of the northern country's supplies, says a report by the Bureau of Foreign and Domestic Commerce. Canada buys more from the United States than from all others combined, having purchased 65 per cent of its goods here last year.

The United States, in 1912, took from Canada 38 per cent. of that country's exports, while to-day, says the report, it takes almost the entire export of Canadian minerals of all kinds, the bulk of its forestry exports, more than half of the manufactures it sends out, and a third of its fishery exports.

In spite of tariff preferences, it adds, Great Britain's share of the Canadian market has steadily declined before the advance of American goods, geography having been too much for tariffs.

CANADA'S PUBLIC DEBT.

DURING August the net public debt of the Dominion increased by $3,681,217, as compared with a decrease of $3,097,926 in August of last year. The net debt now stands at $301,750,895 as compared with $298,009,678 at the end of July.

Expenditure on consolidated fund account for the five months ending with August totalled $39,428,572, an increase of $4,077,435, as compared with the corresponding period of the last fiscal year. Expenditure on capital account for the five months totalled $20,215,144, an increase of $11,513,977 over the corresponding period of last year. The increase includes nearly eight millions in railway subsidies, representing, largely, amounts paid 'on account'' to the Canadian Northern Railway Co., in conformity with the seventeen million subsidy grant of last session.

Revenue for the five months totalled $71,628,457, an increase of $4,725,290, of which $1,626,968 are due to increased Customs collections, $500,000 to growing post office revenue, and $419,435 to Excise, representing increased production of liquor and tobacco.

AMERICAN STEEL COMPANIES' ORDERS.

AMERICAN Steel Companies received some encouragement in August, especially during the second half of the month, from large orders for rolled steel products from manufacturing industries for delivery over periods of six months to one year. From a tonnage standpoint there was a gain of 30 per cent., but prices were lower, and consequently profits were somewhat reduced, but it may be that the increased volume of business compensated for the lower prices. Interest was stimulated, too, by the concessions made by the mills, and there is still considerable buying by consumers in all sections.

The light orders received from the railways for equipment and other supplies was the one discouraging feature. It seems only a question of a short time, however, before substantial railroad contracts are placed. In August, the total volume of business derived by the mills for railway purposes was little more than 165,000 to 170,000 tons, made up of a little over 60,000 tons of rails, 60,000 tons for 4,250 cars, and 10,000 tons for 100 locomotives, as well as 28,000 tons of structural and bridge material.

A £2,000,000 STEEL COMBINE.

A SYNDICATE of well known Glasgow capitalists have just formed a new iron and steel corporation under the title of the Simpson & Oviatt British Iron and Steel Corporation, with a capital of £2,000,000. The company will carry on the business of iron and steel manufacturers, in addition to shipbuilding, mining and construction of railway plant. The firm of Biggart, Lumsden & Co., of Glasgow, members of the Shipbuilding Employers' Federation, are interested in the formation of the company.

REPRESENTATION AT NATIONAL EXHIBITION.

MR. RHYS D. FAIRBAIRN, speaking on the occasion of a Canadian National Exhibition luncheon, said that manufacturers should reserve more space at the exhibition. The large concerns should not be allowed to crowd out the smaller ones, as the former would be the large industries of the future.

The banks had been criticised, but the manufacturers had found that they could get all the money they required for legitimate purposes. The development of the export trade was linked up with transportation, and Canada should have a national railway. He was sure that one of those now building could be bought out.

EASTERN CAR COMPANY.

UNDER date of September 3rd, a despatch from Nova Scotia says: The Eastern Car Company have completed their sample steel box car, and the company's mammoth plant may now be considered as having gone into actual operation. The major portion of the construction work is finished, and cars will be shipped daily. All of the necessary material is now on the ground with everything running smoothly.

Five hundred and sixty men are employed at present, but this number is being steadily increased as fast as others with the requisite skill can be obtained.

MONTREAL PORT REVENUE DECREASES.

FOR the first time during the present financial year Customs and Inland Revenue returns show a falling-off as compared with the month of August, 1912. The decrease in the Customs revenue amounts to $49,193.73, the receipts having totalled $2,269,678.57, as compared with $2,318,872.30 for August, 1912. The decrease in Inland Revenue amounts to $37,863.30, the receipts having been $871,265.54 for August this year, as compared with $909,128.84 for the corresponding month of last year.

Enquiries made at the Customs House and of officials of the Inland Revenue Department tend to show that too much importance may easily be attached to this temporary check, and that it would be premature to contend that there is any diminution of the prosperity of the port to be apprehended in the near future.

There was one working day less last August than in August, 1912. The decline in Inland Revenue has also been partly due to a falling off, apparently only of a temporary nature, in receipts from the importers of cigars.

* * *

GOVERNMENT CONTRACTS AWARDED.

A NUMBER of contracts were awarded at the meeting of the Dominion Cabinet on September 3, which was the most largely attended for some months.

The York Construction Co., of Toronto, was given the final contract on the Trent Valley Canal. This is the Seven River section, and the contract price is $130,273.

Other new contracts are:

The Northern Dredging Co., dredging at Cheticamp, N.S., $15,000.

The Standard Construction Co., wharf at Hautsport, N.S., $18,685.

Quinlan & Robertson, Montreal, rebuilding head of the Grand Pier Canal, $24,283.

The Hamilton Bridge Co., steel bridge over the Chambly Canal, Larocques crossing, $2,450.

The Hamilton Bridge Co., double track railway swing bridge over the Welland Canal, $65,800.

A. G. Marshall, Ottawa, installation of underground services in the House of Commons, $11,995.

Jackson and Goldie, thirty additional targets on the Winnipeg rifle range, $19,500.

* * *

GRAIN VIA VANCOUVER.

IT is claimed that Vancouver will be an important grain-shipping port after the opening of the Panama Canal, when reduced water rates are available. Canadian grain shipments at the present time via the Great Lakes are hampered by the short season.

While heretofore it has been necessary to ship over the Eastern route, with the completion of the new roads to the West, and the opening of the Panama Canal, it will be necessary that exceptionally low rates be offered the shippers of the Western Provinces, such as Alberta and Saskatchewan, in order to induce them to ship via the Eastern route. It is claimed by some that grain shipments through the Panama Canal from this point are impractical on account of the liability of the grain to sweat owing to the heat to be encountered on this route.

The advantage of the Western route becomes more apparent when it is taken into consideration that the Panama route from Vancouver to Liverpool will be cut to 8,800 miles, as against 14,000 miles by way of the Straits of Magellan, and more than 16,000 miles by way of the Suez route. In fact, the time will be practically cut in half. It has been estimated that the entire crop of grain of British Columbia and Alberta and one-third of the crop of Saskatchewan will be exported by way of Vancouver, either in the shape of grain or in manufactured form. The production of this area for 1912 amounted to approximately 179,-330,836 bushels, and this production will be increased upon the opening up of new parts of Canada by the completion of the Transcontinental railroads now under construction.

* * *

ANOTHER GRAIN ROUTE.

IT appears now to be certain that the Canadian Northern Railway will be prepared to haul grain over its new transcontinental line from Port Arthur to Sudbury, and then south to Toronto by the beginning of winter. This will be fortunate, inasmuch as, according to such authorities as Mr. John Aird, assistant general manager of the Canadian Bank of Commerce, and many others, the crop movement will be larger this fall than it has ever been before. The fact of another grain route being opened from the West to the East does not necessarily, however, preclude the possibility of another grain congestion at the head of the lakes this year.

It is important in this respect to note that with the opening of the grain route the Canadian Northern Railway will be able to carry their traffic from British Columbia to the Atlantic by its own right of way. As the route east of Sudbury is not completed, all traffic must necessarily pass through Toronto. This new line is constructed with a view to its carrying heavy traffic.

* * *

GRAIN TRANSPORTATION AND ELEVATOR STORAGE.

THE Quebec Board of Trade has addressed an important document to the Right Hon. Mr. Borden on the question of Canadian grain transportation and elevator storage capacity at the various Canadian ports.

The document has been inspired by the report made from investigation by the Montreal Harbor Commission, which the Quebec Board of Trade endorses, but at the same time points out the expense and great delay in deepening the Welland Canal when the remedy is at hand by the completion of the Transcontinental Railway, which will be finished within a year, and will handle Canadian grain for twelve months in the year instead of six by the canal route.

The document further shows that the Custom ports of Montreal, Quebec, Halifax and St. John have at the present only 12,000,000 bushels elevator capacity, and each port at least should have grain elevators built to gurnish a capacity of 15,000,000, which would put an end to the diversion of Canadian grain through American ports.

* * *

MONTREAL FIRM GETS BIG CONTRACT.

THE contract for section three of the new Welland Ship Canal was let at a Cabinet Council on September 4, to the firm of O'Brien & Doheny, of Montreal. The contract price is $9,540,050.

Section three is the most difficult in the plan of the new canal. It extends over something more than two miles at the town of Thorold, and its construction necessitates a great deal of rock excavation. There are three locks in this section. The firm of O'Brien & Doheny is composed of Mr. M. J. O'Brien, of Renfrew, and Hugh Doheny, of Montreal.

The first section of the new canal along Ten-Mile Creek from Lake Ontario is already under contract to the Dominion Dredging Co. Section two will be advertised for this week.

A contract was also let to-day to J. T. Horne for dredging in Rainy River to cost $29,250.

* * *

SHIPBUILDING PLANT FOR NORTH SHORE.

THE new dry dock to be built by the Federal Government will be built at North Vancouver on Burrard Inlet. The outlay will amount to $4,000,000, and will cover the cost of constructing the largest shipbuilding dry dock and ship repairing works in Canada.

The plant will cover 80 acres, and when in full operation will give employment to over 2,000 men. The basin will give a depth of 30 feet at low tide, and the floating dock will have a lifting capacity of 20,000 tons. The plant will take three years to complete. The contract is in the hands of the Amalgamated Engineering Co., of which Sir Henry Pellatt, Sir J. M. Gibson and D. B. Hanna, all of Toronto, are directors.

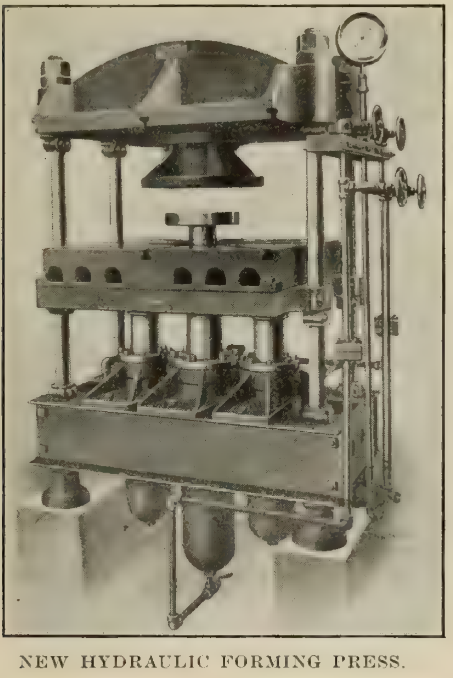
* * *

PETROL SUBSTITUTE FOR AUTOMOBILES.

A DISCOVERY which it is claimed will revolutionize the motor spirit industry and make Great Britain partly independent of foreign supplies is announced by a joint committee appointed some time ago by the Royal Automobile Company and other automobile associations. The secretary of the

Three cylinders and three rams are employed in operating the press. One 6-inch ram operates a blank holder, and two 5-inch rams operate the pressure platen. The centre, or 6-inch ram, is machined to a smaller diameter on the upper end than the bearing in its cylinder. The ram is not attached rigidly to the platen, and, during the first part of its operation, it travels in a bearing through the platen for a distance of 7 inches. Upon the completion of this travel, the shoulder on this ram takes a bearing on the under side of the platen, which causes the platen to travel upward. This causes the two side cylinders to fill by gravity from a surge tank.

When the platen and the main pressure ram is at the lowest point, the blank holding plate of the latter fits into a recess machine in the face of the platen. During the first part of the operation, the main pressure ram raises the blank holding attachment, and later carries up the main platen, as already described. It continues to move the blank holder and platen until the first operation is completed, when the operator turns the pressure into the side cylinders. This causes the platen to continue its upward travel free from the centre ram, and performs the second operation.



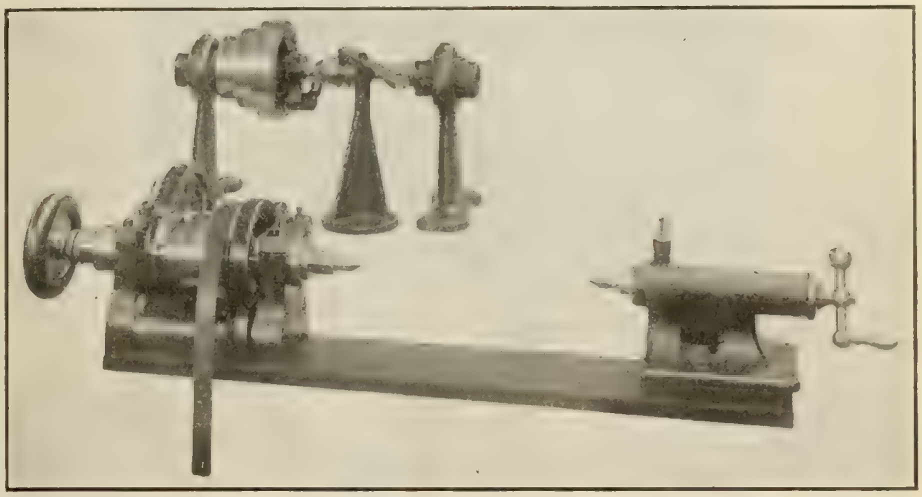
NEW HYDRAULIC FORMING PRESS.

The extension pressure head can be removed for work not requiring it. The platen and pressure head are fitted with tee slots, and the pressure head extension with slots for bolting on different forms. The pressure capacity of the press is 68 tons, the pressing surface is 38 in. x 38 in., the daylight space 9 in. or 22½ in., and the run of the ram, 18 inches. The platen is constructed in a manner that will permit heating in necessary cases.

* * *

BENCH LATHE FOR WINDING SMALL MAGNET COILS.

FOR such work as winding magnet coils, the W. P. Davis Machine Co., Rochester, N.Y., has developed a bench lathe. Although the machine was built for winding magnets for the electric starting devices used on automobiles, it may be available for similar work as may suggest itself on noting the details.



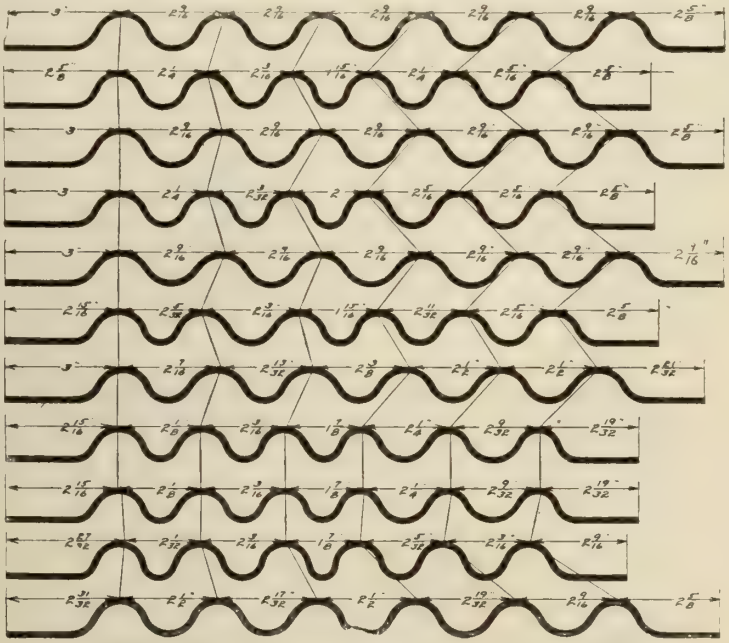
BENCH LATHE FOR WINDING MAGNET COILS.

As indicated in the accompanying illustration, the lathe has a back-geared head with a left-hand thread on the spindle nose. For starting the work, and making necessary corrections, a handwheel is fitted to the rear end. The spindle runs away from the operator, and is driven by a countershaft placed on a bench at the rear of the lathe. A friction clutch is located in the cone pulley, adjusted so that it will slip when a brake consisting of a strap running over the large step of the cone pulley is applied by depressing a foot treadle. The lathes are built in four sizes, ranging from 11 to 18 in., the smallest being that illustrated.

* * *

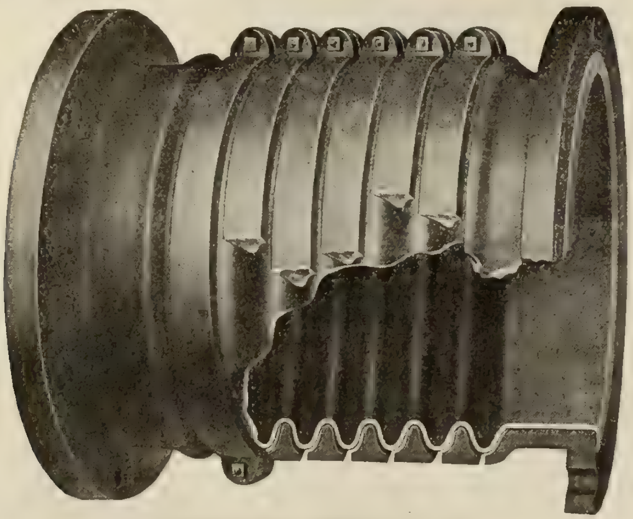
TEST OF A BADGER EXPANSION JOINT.

THE Badger Self-Equalizing Expansion Joint is distinctively a copper joint, corrugated for strength and for taking up the changes in pipe length. The external rings fitting the corrugations add strength to the joint and distribute the change of shape, each ring forcing a part of the change to the next so that the strain is divided among many corrugations, instead of being taken by one or two. It is evident that



TEST DATA OF A BADGER EXPANSION JOINT.

if the changes of shape are subdivided and distributed instead of concentrated the copper will last much longer. How well the Badger distributing rings pass along the strains, equalizing them among a large number of corrugations, is shown by a recent commercial test. The Badger expansion joint was sent for acceptance to a very large manufacturing concern, and having facilities not possessed by small companies, this large plant subjected the joint to searching tests. Approximate working conditions were available, and the accompanying figure shows the results graphically, the actual measurements being shown as well as the relative changes of shape.



BADGER EXPANSION JOINT.

The joint was a big one, 20 inches in diameter and 23¼ inches long between flanges. It had seven corrugations or depressions, and in order to have the joint heated nearly to working temperature it was filled with steam at about five pounds pressure. For testing, the joint was secured at one flange and shortened the desired amount by bolts. In this manner, the joint was shortened as it would be when squeezed together by the increase in length of two lines of pipe.

*

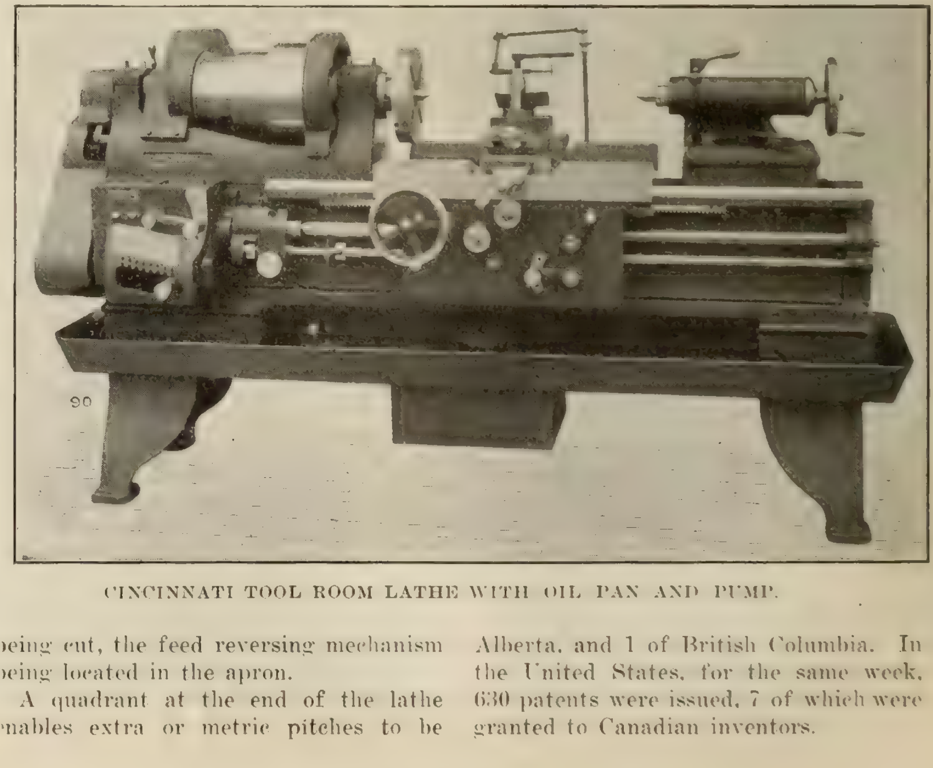
.CINCINNATI TOOL ROOM LATHE..

HE illustration and descriptive text refer to the latest tool-room lathe put on the market by the Cincinnati Lathe & Tool Co., Oakley, Cincinnati, Ohio. In its general features, this machine follows the lines of an earlier product, except that an oil pan and pump form part of the design and equipment.

The headstock is of the double back geared type with three-step cone pulley, designed for a 3¾-in. belt. The back gear quill is of steel, and is bushed at both ends with bronze. A sleeve is mounted on this quill for shifting the double back gears, the motion being transmitted from the front of the machine.

A double wall apron of the box type is bolted rigidly to the carriage, thus giving a double support to all the shafts and studs mounted on it. Motion is transmitted by compound gearing to the steel rack pinion located close to the rack on the bed. The longitudinal and cross friction feeds can be started, stopped or reversed while the lathe is running, but cannot be engaged when cutting screws.

A thread chasing dial, which forms a portion of the lathe equipment, allows the carriage to be run back by hand, and the thread to be caught or picked up at any point without reversing the lathe, after the half nuts are opened. A reverse plate, which is mounted on the outside of the headstock, is used for reversing the lead screw when threads are being cut, the feed reversing mechanism being located in the apron.



CINCINNATI TOOL ROOM LATHE WITH OIL PAN AND PUMP.

A quadrant at the end of the lathe enables extra or metric pitches to be combined with the regular U.S. standard lead screw, in addition to those provided in the gear box, by simply shifting two levers. These changes can be made while the lathe is running under a heavy cut, and in addition to cutting the pitch required, each gear will also cut others through the series of gear box changes.

The screw cutting and feed mechanism is assembled as a complete single unit in a box mounted on the front of the bed, and an index plate attached to the box enables the operator to see at a glance the correct positions of the two levers for any thread or feed. Another convenience of this arrangement is that the two levers are placed but a few inches apart. The lathes can be fitted when installed, or at any time afterwards, with draw-in, relieving and taper attachments.

We have been advised that, about two weeks ago, one of the above lathes at work in the maker's shop negotiated successfully a ¾ inch cut when operating at 80 feet per minute, and that accuracy to within .001 of an inch is their guarantee.

*

INFORMATION FOR INVENTORS.

Pigeon, Pigeon, & Davis, patent solicitors, Montreal, report that 125 Canadian patents were issued for the week ending August 19, 1913, of which 80 were granted to Americans, 21 to Canadians, 12 to residents of Great Britain and Colonies, and 12 to residents of foreign countries. Of the Canadians who received patents, 10 were residents of Ontario, 6 of Quebec, 1 of Nova Scotia, 1 of Manitoba, 1 of Saskatchewan, 1 of Alberta, and 1 of British Columbia. In the United States, for the same week, 630 patents were issued, 7 of which were granted to Canadian inventors.

CASEY

WHAT IMPRESSED CASEY IN THE MACHINERY HALL OF THE CANADIAN NATIONAL EXHIBITION.

is turning out a lathe per day, and is not grumbling at poor trade.

Machinery Accessories.

Crescent belt fasteners were to be found at almost every booth in the hall where belting was on sale, but the makers had a special representative at the booth of W. A. Martin & Co. in the person of Herbert Walker. Mr. Martin used to represent the Canadian British Engineering Co., Ltd., in Toronto, but has now taken over that concern's operations for the whole of Ontario, and will open new premises at 70 Lombard Street, carrying a full stock of tool steel, electrical equipment, gas engines, leather and Gripoly belting, Graton & Knight belting, and air compressors. Associated with Mr. Martin is W. R. Green, the sales manager, a young American engineer of great promise. He was in charge of the firm's booth.

The Garlock Packing Co. of Hamilton drew the attention of the passers-by by means of a supply of Keystone grease circulating in a motor car gear box, run by a small electric motor. H. G. Fletcher represented Garlock, and in the same booth was a supply of Lunkenheimer engine specialties, in charge of E. A. Wilkinson.

Kester T. Barr, manager of the Lumen Bearing Co., Toronto, was a familiar figure at the ''Ex.,'' his firm having a splendid exhibit of drop forgings. J. K. Young, master mechanic of the die casting department, did considerable explaining, astounding the farmers with his marvellous figures. ''No machine work,'' he explained; ''just as it leaves the die, and true to a thousandth part of an inch. The metal is subjected to a pressure of 200 lbs. to the square inch.'' And so on.

J. B. Faatz represented Cling-Surface Co., Buffalo, N.Y., and his catch was a lifebelt bearing the words: ''Cling-Surface life-saver for belts.'' Not a bad idea.

John F. Haas wasn't giving anything away, but he would spend his valuable time explaining how Dodge pulleys were made, and how they were superior to other makes. Incidentally he was not the only one there in this line. The Positive Clutch and Pulley people had a booth, and Reeve's pulleys were shown in the A. R. Williams exhibit.

The Canadian Pneumatic Tool Co. did not excite much interest in their electric headlight for locomotives. Truth to say, there were not many people there who used locomotives, but J. B. Wilson, the Ontario representative of The Holden Co., Ltd., did his best to educate the spectators in the use of electric and compressed air drills. He also had a new portable electric grinder for engine cylinders, just on the market.

W. D. Beath, maker of cranes and runways, was present in person at the Exhibition to show his wares. He found more farmers than foundrymen looking around, but there were quite a number of the latter who were interested in his well-known creations, some of which are quite new. W. D. Beath caters to such a wide trade, that he was kept continually on the go.

There were plenty of others at the ''Ex.'' of greater or lesser note. There was Mr. De Milt, of the Perolin Co. of Canada, looking like a druggist with his bottles, showing to groups of eager spectators how Perolin saves the boiler flues. The Dearborn Chemical Co. had a representative there for the same purpose.

Humorous Side to the ''Ex.''

Quite a lot of people who visit the Toronto Exhibition go there to see what they can pick up in the way of samples. It is rather difficult for machinery men to oblige them in this. Lathes, belting and cling-surface are not handy things for souvenirs; but there was one man in the Machinery Hall who did give away souvenirs. Whenever a visitor asked for something along this line, he or she was generally directed to a certain booth. ''Do you give anything away?'' was the question usually put. ''Yes,'' replied the machinery man, ''I have some ladies' coat hangers. Will you take one?'' Nobody ever refuses a coat hanger, so the reply was in the affirmative. The Machinery Hall rocked with laughter every time a couple of six-inch nails were handed over.

Something went wrong with the clothing of one of the lady visitors as she passed through the Machinery Hall. Whatever it was, it worried her considerably. When she and her escort arrived at the booth where a certain famous leather belt fastener was being boosted, a splendid idea struck her. Leaning over to the attendant, she asked if these fasteners were for ladies' belts, and could they be attached to the hose? The engineer blushed, and quietly explained the situation.

The machinery men were genial fellows on the whole, but one there was among them handy with his fists and of unusual physical proportions. He went out for dinner, and ordered fish as a side. He made sure from the waitress that fish was not an extra, but when the meal was over an extra ten cents was charged. The caterer made an effort to secure the dime, and only relaxed his efforts when the machinery man threatened to clean up the show.

J. K. Young, of the Lumen Bearing Co,. was giving away exact reproductions of locomotive bearings, one-twentieth of the original size. Visitors were told to put these in their pockets, as if they lost themselves these would enable them to find their bearings again.

By the time nine o'clock p.m. was reached, most of the booths in the machinery section were vacant. There were spectators, however, who lingered around until ten o'clock looking for sparks flying, and wondering why the electric welders were not at work. At that hour an officious little man, backed by a couple of policemen, came around and bustled everybody out, no matter how important the business being done.

STEEL BELTS.

WHEN most manufacturers and owners of factories are looking for new methods of reducing the ever-increasing initial costs and getting a better return for any outlay, says ''The Engineer and Iron Trades' Advertiser,'' it is not surprising that the potentialities of steel belt transmission in these directions are beginning to be appreciated. Though more than six years have passed since the ''Eloesser'' system was introduced on the continent of Europe, and over 100,000 h.p. has since been installed there, it is only lately, that a few of the more daring firms have ventured to adopt the system.

The belts are made from a specially hardened charcoal steel prepared by a secret process, and the finished material has a tensile strength of 95 tons per square inch. The length of each belt is constant, and no subsequent readjustment is required. Thicknesses vary from .2 to 1 mm., and the widths from 1½ in. to about 8 in., according to working conditions and the maximum h.p. to be transmitted. The tension required on the belt over flat or rope converted pulleys is determined by a special patented instrument, and only one flexible steel joint—designed so that its rigid portion does not hinder transmission—is necessary.

Since being perfected, no breakages have occurred at this joint, indeed the only breakages (caused mostly through faulty alignment of shafting or pulleys) during a whole six years' running have been less than one per cent. over all the installations. Once tension requisite to transmit the required horse power is determined, the length remains constant, there being no appreciable stretch; but so that metal does not run to metal, and to take up any possible slip, a friction coating consisting of a layer of canvas, to which is glued fine sheets of cork, covers the rims of the pulleys. Thus, the slip is very low, and consequently a very high transmission efficiency can be guaranteed.

Under several conditions, the system is unsuitable, but for continuous drives above 10 h.p., no matter how close or distant the centres, whether horizontal, vertical, or tangential drives, the system has many advantages.

committee says they tested a substitute for petrol, which is a by-product of coal, and which hitherto has been unsuitable as motor fuel. The expert of the commission made the fullest investigations, with excellent results.

A big commercial plant is now being built, and indications are that, when the process is fully going, forty million gallons will be produced. It can be sold at 28 cents a gallon, as comparred with the present price of 42 cents. It is figured that the present British consumption of petrol is 100,000,000 gallons a year.

* * *

CANADA'S BALANCE OF TRADE.

DR. JAMES BONAR, of the Canadian Mint, read a paper on "Canada's Balance of Trade" before the Canadian Political Association.

Canada has what used to be called an unfavorable balance of trade, said Dr. Bonar. That is where imports exceed exports. With Canada, however, this was a healthy unfavorable balance. The Dominion had for the last ten years been borrowing municipally from England about $200,000,000 per year. This big indebtedness, particularly that of Canada's debt to Britain, was difficult to account for, since the British Empire as a whole sent us nineteen and a half millions less than it received. There was only one country, the United States, which would account for this amount, a country which in 1911 exported to Canada about $170,000,000 more than she imported.

The Ins and Outs.

From all of this Dr. Bonar drew the conclusion that American trade was financing English loans. That is, English money was given to Canadians and used to buy American goods. Not only did the loan depend on the American trade for the machinery of delivery, but, to the amount concerned, it created the American trade. When Canadians did anything to increase the price of American articles purchased, they increased the cost to themselves of their own supplies, and thereby lessened the effective amount of the loan itself. The standing of the three countries was this:

England was increasing her claims for interest even faster than her granting of loans, hence an unfavorable balance excess of imports. Canada was increasing her debts faster than her payments of interest, hence the same condition of affairs. The United States were increasing their payments of interests faster than their borrowings, hence a favorable balance excess of imports.

The effect of the introduction of American capital to establish business here was similar to the effect of an English loan to help us establish our own, said Dr. Bonar. Such a continuous invasion of another country, as that of the Americans here, was a new thing in economic history, and was far more important than the effects of it on the balance of trade.

NEW ELEVATOR NEARING OPERATION STAGE.

THE new million-bushel Grand Trunk elevator will surely be in operation by November 15," was the statement of Mr. George Hanna, manager of the Montreal Warehouse Co., a few days ago.

"You can rest assured," continued Mr. Hanna, "that there will be no hitch to prevent everything being in the best of running order on that date, and we will be glad to handle double the amount of grain during the coming year, which we did last.

"The system of building has been made to conform, in every way, with the present and future needs of the grain trade for both local and export account. No machinery outside of carriers for elevating and carrying grain to different parts of the twenty-eight bins will be installed in the new elevator, and for this reason we will have no mechanical apparatus to instal to hinder the completion of the structure, and prevent the needed extra storage capacity being put at the disposal of our patrons on the date mentioned."

* * *

CANADIAN TRADE.

DESPITE the report of financial stringency throughout the country, Canadian trade reached high water mark for the month of July.

A statement issued by the Department of Customs, recently, shows that for July the total Canadian trade was $100,357,000, compared with $91,423,000 for July, 1912.

For the first four months of the present fiscal year ending July 31, the total Canadian trade amounted to $358,488,000, compared with $328,635,000 for the corresponding period last year.

At the present rate of progress, the trade of Canada for the present fiscal year will considerably exceed the record of one billion for the last fiscal year.

Imports into the Dominion of durable goods and free goods for July amount to $58,928,000, an increase of over $2,000,000 over July 1912.

For the four months ending July 31, the imports were $225,887,000, compared with $209,334,000 for the corresponding four months of 1912.

The duty collected for the four months of this fiscal year was $38,531,000, compared with $35,990,000 for the previous period of 1912.

The exports of Canada show a healthy increase. Agricultural products for July last were $11,497,000, as against $10,251,000 for July, 1912. For the four months of the present fiscal year the exports of agricultural products were $51,622,000, compared with $47,221,000 for the first four months of the fiscal year, 1912.

The grand total of exports for July last were $33,660,000, as against $31,042,000 for 1912, and for the four months of the present fiscal year the exports are $117,180,000, compared with $107,308,000 for the corresponding period last year.

* * *

PORT OF MONTREAL.

THE number of ocean steamers arriving in Montreal month by month is continually increasing, as compared with previous years. Arrivals during August numbered 72, as compared with 56 for August, 1912, and their combined gross register tonnage was again not far short of the half-million mark, being 472,765 tons.

The total number of ocean steamers which have arrived in port since the opening of navigation to August 31 inclusive, is exactly 300, as compared with only 245 for the similar period last year. Taking April and May together this year, the number of arrivals up to May 31 was 76, as against 73 last year, when navigation was later opening. During June the numbers were 81 this year, and 54 last; during July, 71 this year and 62 last; and for August, as stated, 72 this year and 56 in 1912. The increase, as will be noted, is not at all sporadic, but steady and well-maintained.

Of the 72 ships arriving during the past month, 13 were Allan liners, one an Austro-American liner, 5 C.P.R., 3 Canada liners, 3 Direct, 4 Dominion, 4 Donaldson, 1 Elder-Dempster, 5 Furness, 3 Head liners, 4 Manchester, 1 New Zealand, 3 C.N.R., 6 Thomson, 4 White Star liners, and 9 tramp steamers. The last named is a class of steamer that will show a marked increase compared with former seasons when this year's returns are made up.

$90,000 DREDGING CONTRACT.

THE Sault Dredging & Construction Co. of Sault Ste. Marie have been awarded the $90,000 contract for dredging the channel between Goat Island and Little Current on Manitoulin Island, to a depth of 22 feet. The largest freighters on the lakes will then be able to dock at Little Current, and it is probable that the dredging is but the first part of a big programme of terminal facilities at that point.

The Lure of the Machinery Hall at the 1913 Exhibition

Staff Article

Being an account of things and men, at the Canadian National Exhibition, Toronto, who attracted unusual attention in the Machinery Hall, but laying no claim to cover the big field or all the exhibits found inside that building.

TO thousands of people in Ontario the Machinery Hall at Toronto Exhibition provides an opportunity to get in touch annually with the many utilities on which they are so dependent, and yet understand so little. To the average man it is a most uninteresting affair this Machinery Hall, but he usually takes it as he does his annual bath, as something that should be gone through at least once. One wonders what all those people who pass through this section of the Exhibition find to interest them in roll after roll of leather belting, etc. There are some wiser than the others, who know that the average man will stop and look at something spectacular, even when the mind fails to grasp the meaning of it; so The Canada Metal Co., with their tiers of babbitt and other metals, attracted big crowds by means of an electrical display portraying a workman pouring babbitt metal.

Then the electric welding machines and the experiments conducted by L'Air Liquide Society were great attractions. Of the former, The Fisher Motor Co., of Walkerville, and the Chapman Ball Bearing Co., Toronto, each had one, while, on the latter, experiments were conducted behind blue sheet glass, so as not to injure the eyes of spectators.

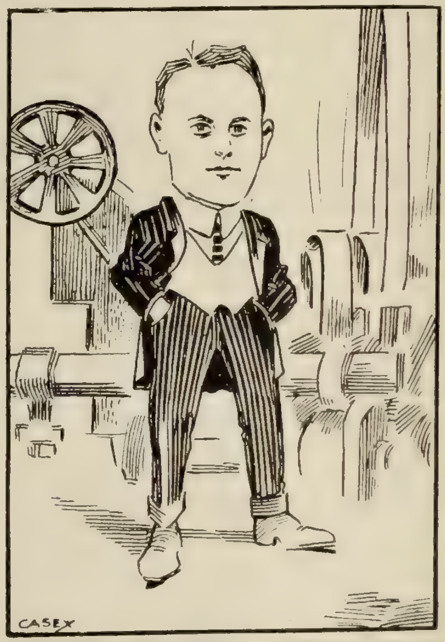
Things Brand New.

Of things brand new in the Machinery Hall, the newest was probably a Brown, Boggs press, equipped with a universal safety device. It was operated in the A. R. Williams Co. section by the inventor, J. Wright, a Hamilton man, and a first-class mechanic. He is superintendent of the E. T. Wright Co., Ltd., Hamilton, makers of tinware and galvanized iron products. He, with William S. Stacey, will superintend the manufacture of these machines. This is the first on the market, and was rushed specially for the Exhibition. The invention is simply a device to save the operator's fingers, and is very effective.

Electric Welders and Ball Bearings.

The chief exhibit of the Fisher Motor Co. was an electric welder, which opens wide the mouths of country visitors. It is difficult to figure out who is the Fisher Motor Co., since they have not been in this world long. The electric welder is the product of Fred W. Vollans, a prominent Walkerville engineer, who originated the F. W. Vollans Machine Co. The Fisher Motor Co. are manufacturers of motor trucks, and as this company was reported last week to have bought out the Tudhope Motor Co. of Orillia, Ont., their products will now number three. Both F. W. Vollans and Frank E. Fisher were at the "Ex." at various times. The electric welders were in charge of W. H. Smith. He reported giving exhibitions to spectators, who turned out to be clever American engineers, and were in Toronto simply for what they could pick up in the way of ideas. Other exhibitors have remarked this.

The Chapman Ball Bearing Co. secured as advantageous a position as there was in the building, and made good use of it. Besides the customary display of steel balls forming the word Chapman, there was an electric welding machine in charge of Mr. Agnew, of the Canadian Welding Co., Walkerville, Ont., used for making the cages in which the balls are housed. W. J. Murray was in charge.



TOM REID IN THE A. R. WILLIAMS CO. BOOTH.

Machine Tools.

If the exhibit of the A. R. Williams Co., of Toronto, had been taken out of the Machinery Hall there would have been a big vacant spot, and one of the most interesting exhibits to the man in the street would have been lacking. This was the demonstration on a Warner & Swasey universal hexagonal turret lathe. Frank Castle travels around with the company's machines, and it was he who gave a special show on chucking work at the "Ex.," demonstrating how work could be done in 20 minutes which would take two hours and a half on an engine lathe. W. E. Marshall represented the firm of Warner & Swasey, and T. P. Burton was in charge of Williams' exhibit, which was very extensive. Messrs. Williams, Hollinrake and T. Reid paid visits to the Hall when circumstances permitted them.

A colored boy was employed by the Borden-Canadian Co., Toronto, to show the visitors how easy it is to operate their die stocks. He was a sort of help to J. Monaghan, who was in charge. Some old farmers found they were not so strong as the colored boy.

There was a line of shafting carrying immense pulleys in the Canadian Fairbanks-Morse Co. booth, but where the power to operate this came from no one could make out. To those who made enquiries, R. H. Noble, who was in charge, pointed to a sixteenth of a horse-power motor, connected by a piece of string. He added that the shaft was two inches out of line, but this was taken care of by the self-aligning feature of "Skefko" ball bearings, on which it was running.

When an artist on the staff of "Canadian Machinery" stood near the booth of the Canada Machinery Corporation and commenced making a few graceful curves in his notebook there was a figure appropriately enough pointing out the good qualities of a shaper. When it was all over, he saw the artist, and moved away. It was the modest A. M. McGill, Toronto representative of the C. M. C. He was in charge of the exhibit during the week, and was aided at various times by several others from the shops at Galt. Among those noticed around were B. H. Niel, purchasing agent; V. Boyd, sales manager, who called on Saturday, and "Bill" Baird, the South-west Ontario representative, who has been twenty-one years with the company. Besides a number of woodworking tools, Mr. McGill was showing a 20 x 12 engine lathe, and a 24 x 30 shaper. He remarked that several American machine tool men had visited the exhibit, and had expressed surprise that such fine products could be turned out on this side. Incidentally, the C. M. C.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, September 8, 1913.—There has been little change in business conditions during the past week. A fairly steady volume of trade is being done, and one hears few complaints except with regard to collections, which are still difficult to make. There is not much doing in the heavy machinery trade, and brokers do not look for any marked improvement before the end of the year. Tenders have been submitted on the equipment for the machine shop of the Atlantic Sugar Refineries' new plant at St. John, N.B.; but an early allotment of the order is not probable, and there seems to be a general feeling that the amount of equipment eventually purchased will be a great deal less than that on which tenders were invited.

Pig Iron, Copper, etc.

There is nothing yet to record concerning the reorganization of the Canada Iron Corporation beyond the fact that Mr. Francis F. Whyte has relinquished the receivership, and has returned to New York. The Montreal Trust Company has been appointed receiver in his place.

The present low price of English pig is resulting in a steadily increasing placing of orders by consumers. The orders rule on the small side, but dealers are at present in a very optimistic frame of mind with regard to the future.

Copper is very firm, with a strong demand from all quarters. Standard copper reached £75 in London to-day, that being the highest price attained for a very long time. Labor troubles in the Lake Superior district seem to have quieted down, and a good supply of ore is now coming forward.

Toronto, Ont., Sept. 9, 1913.—Dealers in machine tools noticed a distinct improvement in business this week. This was not due to the Exhibition, however. Whatever the reason, all the dealers spoken to were jubilant over last week's sales and future prospects.

Pig Iron, etc.

Two more blast furnaces have closed down in Ontario during the last week, but it is explained that this is due to accidents, and not to failure to compete with American concerns. Prices for pig iron are firm. The Steel Co. of Canada's price for foundry pig iron is $18.50 per gross ton. Steel bars are firm. Implement concerns are withholding their orders, although the International Harvester Co. of Hamilton, Ont., who reopened their plant this week, following a month's holiday, have placed orders for a big supply of bars. Reinforcing steel is in great demand. Steel wire is firm, and copper wire went up ½ cent yesterday. The price of sheets just now is described as a "good buy." Business in steel generally is only about half what it was a year ago, which was a record year.

Metals.

Manufacturers may expect a rise in New York copper, and a fall in all kinds of lead owing to the strike in American mines, and a better situation in Mexico, which will increase the output. Tin rose a cent per lb. last week, but little metal is being sold. The copper market in England is firm, but in New York things are quiet. It is a peculiar situation. Toronto dealers are buying largely of old material, due to a general loosening up, caused by better prices prevailing now than two weeks ago.

STRATFORD'S G.T.R. BOYS MADE CLEAN SWEEP.

THE city of Stratford made a clean sweep in the prizes for mechanical drawings at the C. N. Exhibition. The winners are all apprentices in the Grand Trunk shops at Stratford. There were twenty-five drawings in the competition, many of which were from Montreal. The following are the results:—

Drawings of steam driven machinery, 1st prize, $20—J. F. Tonye.

Drawings of electrical equipment, 1st prize, $10—L. Bexon.

Drawings of hydraulic or pneumatic machinery, 1st prize, $10—L. Ireland.

The city's showing reflects great credit on Master Mechanic Robt. Patterson.

* * *

Nearly 1,000 girls are being taught to operate electrically driven machinery in a New York trade school.

Machinery Display at the Canadian National Exhibition

Staff Article

The variety, quantity and quality of the machinery exhibit at the Canadian National Exhibition, in Toronto, for this year, 1913, the enthusiasm displayed by those represented by, and in charge of, the different lines shown, and the evidently increasing interest taken by the public in this important feature of our National development and achievement, go to show that those responsible for the direction of the undertaking as a whole would be consulting the popular demand and manufacturers' desire, were immediate steps taken to provide accommodation commensurate with the place and part which machinery occupies and plays in our country's upbuilding.

The Lumen Bearing Co., Toronto had a large number of die-castings on view.

The Wells Pattern & Machine Works, Toronto, showed a full line of foundry chaplets.

The Jones & Moore Electric Co., Toronto, showed a number of "Century" electric motors.

The Augustine Automatic Rotary Engine Co., Toronto, exhibited several of their rotary type engines.

The Brownwall Engine and Pulley Co., Lansing, Mich., showed several gasoline engines in operation.

MacDonald & Sons, Ltd., Toronto, showed steamfitters' supplies, such as pipe threaders and wrenches.

The Ontario Wind Engine and Pump Co., Toronto, showed a number of "Chapman" gasoline engines.

L'Air Liquide Society, Montreal, were demonstrating their oxy acetylene process for welding and cutting metals.

The "Honest Injun" Motor Co., Toronto, were represented by a number of their "Honest Injun" gasoline engines.

The George B. Meadows Co., Toronto, were located in the Industrial Building, and exhibited their "sure grip" metal lockers.

The Dennis Wire and Iron Works, Ltd., London, located in the Process Building, had on show examples of their metal lockers.

The Cling-Surface Co., Buffalo, were distributing literature and demonstrating the merits of their well known belt dressing.

The Can. Fairbanks-Morse Co., Toronto, had an exhibit in the Agricultural Section, consisting of gasoline engines, scales, etc.

The Positive Clutch and Pulley Co., Toronto, showed a number of their wood rimmed pulleys with pressed steel spokes malleable iron hubs.

The Massey Harris Co., Ltd., Toronto, showed a number of oil engines, driving pumps and demonstrated a power spraying apparatus for farm work.

The Dominion Belting Co., Ltd., Hamilton, had on hand supplies of their well known "Maple Leaf" brand of cotton duck belting and dressing.

Julius & August Erbsloh, Barmen, Germany, represented by the Canadian Aluminum Products Co., had a full line of aluminum products on view.

The British Aluminum Co., Ltd., Toronto, had a varied and interesting exhibit showing the many purposes for which aluminum can be employed.

D. K. McLaren Co., Toronto, exhibited a complete line of their well known "British" oak tanned leather belting, also steel split pulleys and mill supplies.

The Schaeffer & Budenburg Mfg. Co., Brooklyn, N.Y., were represented by a complete line of their well known pressure gauges and the "Resisto" gauge glass.

Jones & Glassco, Montreal, demonstrated the Renold silent chain drive. They had also a show case containing various sizes and sections of Renold chains.

The William Hamilton Co., Ltd., Peterborough, Ont., exhibited a "Samson" water wheel, a centrifugal type "stuff" pump for pulp mills, and some saw mill machinery.

The J. L. Morrison Co., Toronto, representing the Advance Machinery Co., were exhibiting several paper cutting machines for bookbinders, paper makers, printers, etc.

The Dearborn Drug & Chemical Co. of Canada, Ltd., Toronto, through their representative and printed matter, explained the merits of the Dearborn treatment of boiler feed water.

The Garlock Packing Co., Hamilton, had on hand a full line of their well known packings and greases. They were also showing Lunkenheimer valves and other of this company's specialties.

The Canadian Pneumatic Tool Co., Ltd., Montreal, showed an extensive line of "Duntley" electric tools, compressed air riveters, drills, etc. The "Fyle" steam-driven electric headlight for locomotives was also exhibited. The Holden Co., Ltd, Montreal, are the sales agents.

The Agnew Electric Welder Co., Ltd., Walkerville, Ont., exhibited an electric spot and butt welder, the former being in operation and welding Chapman ball bearing carriages as a demonstration.

Cowan & Co., Galt, Ont., showed a number of woodworking machines, such as a chain saw mortice, 12 in. moulder, 12 in. power feed rip saw, cross cut and mitre saw, and a vertical hollow chisel mortice machine.

The Fisher Motor Co., Ltd., Walkerville, Ont., were exhibiting the "Vollans" spot and butt electric welding machines, and showed the various classes of work that these machines are capable of handling.

The Borden-Canadian Co., Toronto, had a full line of their "Beaver" and "Premier" die stocks and pipe cutters. The latter are of new design, made in two sizes, and embody several new and distinctive features.

Canadian Quality Saw & Tool Works, Montreal, had a Robertson power hack saw machine for demonstrating in connection with their "Quality" hack saw blades. They also showed the "Jennings" expansive bit.

William C. Wilson & Co., Toronto, exhibited a full line of packings and mechanical rubber goods, the product of the Home Rubber Co., Trenton, N.S. The O.I.M. and N.B.O. packings were two of the principal features.

The Preston Woodworking Machinery Co., Ltd., Preston, Ont., exhibited for the first time and had a number of machines on view including a 36 in. band saw, 24 in. pony planer, 12 in. jointer and a variable feed saw.

The Canada Machinery Corporation, Galt, Ont., staged an interesting exhibit of metal and wood-working tools, the principal being a 20 in. engine lathe, 24 in. crank shaper, 12 in. four side moulds, 12 in. inside moulder, tenoning machine with cut-off saw, chain mortice and sash trimmer.

The Linde Canadian Refrigeration Co., Ltd., Montreal, P.Q., had an interesting exhibit in the Government Building, where they have a plant working in connection with the refrigeration system installed there for the protection of perishable goods.

R. A. Lister & Co., Toronto, had several oil engines in operation, the principal of these being the Lister-Bruston 40-light automatic electric lighting set, which is so constructed that the engine will begin to operate by simply turning on the lighting switch.

The Twin City Oil Co., Berlin, Ont., showed two novelties—one being the "Manzel" tire pump and the other the "Taber" boiler compound feeder. The former is attached to an automobile engine and the latter is an automatic device attached to the feed pump.

The Canadian Fairbanks-Morse Co., Toronto, exhibited their well-known line of transmission machinery including "Skefko" ball bearings, pulleys, hangers, grip nuts, belting ,etc. They had a shaft running in "Skefko" ball bearings to demonstrate the frictionless features of the latter.

The Canadian Morehead Mfg. Co., Woodstock, Ont., exhibited their well-known steam traps. A condenser trap with boiler feed, a non-return trap and a No. 6 return trap, were on view. This firm also handle the "Otis" feed water heater. G. W. Cole and E. I. Bickle were in charge of this exhibit.

The Dodge Mfg. Co., Toronto, had as usual an interesting exhibit of their well known line of power transmission machinery, including steel and split wood pulleys, bearings, hangers, etc. A wood pulley was to be seen showing clearly the method of manufacture. Mr. John F. Haas had charge of this exhibit.

The General Machinery Co., Toronto, exhibited the "Munciel" crude oil engine and Luitwieler pumps. The engine is of the semi-Diesel horizontal type, was operating a triplex pump. A vertical motor driven Luitwieler pump was also shown in operation, together with two other pumps operating a pressure tank system.

S. F. Bowser & Co., Inc., Toronto, had an exhibition in the Transportation Building and also in the Industrial Building. They were demonstrating the merits of the "Bowser" system for storing and distributing lubricating oils, gasoline, etc. Equipment noted included self-measuring hand and power driven pumps, tanks, oil filters, etc.

The Canada Metal Co., Ltd., Toronto, had an excellent display of their well known products, such as lead pipe, plumbers' supplies, copper ingots, zinc., spelter, as also samples of various brands of babbitt metals, including the Harris heavy pressure babbitt. One feature of this exhibit was an illuminated sign showing a man pouring metal.

W. A. Martin & Co., Toronto, showed an interesting line of engineering and mill supplies. The principal features were the "Gripoly" woven hair belting, "Neptune" and "Spartan" leather beltings, Darwin & Milner's high-speed steels. This firm represents the Canadian British Engineering Co. They also showed the "Callender" babbitt, phosphor bronze, etc.

H. L. Pieler Co., Toronto and Montreal, had a full line of Ashton valves, Mason regulators, and Bundy steam traps on view. Sharing the same stand were **The Engineering Specialties Co., Toronto**, who were showing their quick action blow-off valves, "Flexible" tube cleaners and Jefferson unions. A new appliance is the "Hardt" generator for hot water systems.

Keith's, Ltd., Toronto, had, in the Machinery Hall, an interesting exhibit, consisting of a refrigerating plant, complete with ammonia compressor, condenser and piping, etc. The compressor is a "Frick" machine of 6 tons capacity, of the vertical two-cylinder type, and was operated by a 10 h.p. C.G.E. motor. They also had an exhibit of electric fixtures in the Process Building.

The Boiler Repair and Grate Bar Co., Toronto, showed the 20th century shaking and dumping grate bar. Their booth was shared by **The Perolin Co., of Canada, Ltd.**, who handle "Perolin" for boilers. This is a comparatively new material on this market, and, while not, strictly speaking, a boiler compound, is used for preventing the formation of scale in boilers. Several exhibits are shown indicating its preservative effect on metal. Mr. S. De Milt was in charge of this stand.

The James Morrison Brass Mfg. Co., Toronto, were located in the Industrial Building, and had a full display of the various lines which they manufacture. Their products exhibited included steam and hydraulic pressure gauges, injectors, stop valves, engine counters, safety valves, engine-room telegraphs, etc.

The Northern Electric Mfg. Co., Montreal, had an attractive display in the Industrial Hall, exhibiting their telephones, fire alarm and electrical apparatus.

W. D. Beath & Son, Ltd., Toronto, gave demonstrations of their overhead industrial tracks and runways, one exhibit being an overhead track with a 3-way switch and cross over, both operated from the ground by chains; stops being fitted to prevent the trolley running into an open switch. A special type of trolley is used with this equipment. An overhead foundry track with a fixed switch was shown, the direction of the trolley being controlled by a stop placed in front which engages with the switch and is operated from the ground.

The A. R.Williams Machinery Co., Toronto, occupied their old stand at the western entrance of the Machinery Hall, and had on show a number of machine tools, including an "American" 16 in. high duty lathe, a "Barkey" No. 4 grinder, "Hanfield" presses, a Hendey Machine Co.'s No. 2 universal milling machine, a Smith & Mills 12 in. shaper, Herbert Morris Co. chain blocks, and a case of taps and dies by the Canadian Tap and Die Co., Galt, Ont. They were also demonstrating a Warner & Swasey universal hollow hexagon turret lathe. In another section they had an exhibit of motor boat engines.

The Chapman Ball Bearing Co., of Canada, Toronto, occupied considerable space in the centre of the Machinery Hall. Several interesting exhibits were to be seen, among these being a testing plant for demonstrating the saving in power that can be effected by using ball bearings as against the ordinary type. Pressure put on a shaft running in a set of ordinary bearings, by a hydraulic jack and readings taken from an ammeter show the amount of power absorbed. The same test is made with "Chapman" ball bearings. The comparative results record the difference in power necessary to drive the respective shafts.

C. P. R. INSPECTION TOUR.

SIR THOMAS SHAUGHNESSY, president of the C.P.R., left Montreal with a party at 5.35 Wednesday afternoon, September 3, on the annual tour of inspection of the system preparatory to the annual meeting of the Company, to be held October 1. The party will be away three weeks, and will go straight to the coast. With Sir Thomas were Messrs. R. B. Angus and H. S. Holt, Montreal, Sir Edmund Osler and Mr. W. D. Matthews, Toronto, while Sir William Whyte will join the party at Winnipeg.

From Vancouver and Victoria a trip will be taken on the new steamer, Empress of Asia. The party is going by way of Minneapolis, Moose Jaw and Calgary. Some important announcements may be expected to follow the return of the party.

Calgary, Alta.—P. Burns & Co., Ltd., packers, exporters, etc., have rebuilt their plant, which was burned. They have installed a 250-ton refrigerating machine, with twin compressor, 17½ inches diameter ,and 42-inch stroke, and twin high pressure Corliss engines, 24 in. diameter, and 42 in. stroke. This, together with high pressure side and atmospheric condenser, was furnished by the Ice and Cold Machine Co., St. Louis, Mo.

Marine

Lake Steamer Changes Hands.— The well-known lake steamer C. A. Jaques, owned by the Jaques Transportation Co. has been acquired by the R. & O. Navigation Co. The steamer is 2,105 tons gross, and 1,590 net, and was built at Dumbarton, Scotland, in 1909.

C.P.R. Steamship Sale. — The steamship "Prince Rupert," for some years in the Bay of Fundy service here, has been sold by the Canadian Pacific Railway Co. to West Indies interests, and will be employed in those waters. The "Prince George" has taken the "Prince Rupert's" place.

Halifax, N.S.—How to provide accommodation for the greatly increased winter port buisiness, was the question under consideration at a recent session of the Board of Trade. The dock accommodation is now a live issue with the port. The business of Halifax increased more last year than that of any port of Canada, and this year the port is to have three additional lines of steamers, one of which is going to run six boats a month. A suggestion was made that steps be taken towards having the pier, now under construction at the terminals, temporarily arranged to give two extra berths.

Contracts Awarded

Regina, Sask.—The contract for the construction of the Downing Shoe Co.'s plant has been awarded to Fried Lewis Co., of Winnipeg, for $45,850.

St. Thomas, Ont.—A contract has been awarded by the Michigan Central Railway to the Goldie & McCulloch Co., Galt, Ont., for four 250h.p. water tube boilers.

Fort William, Ont.—The Fort William Starch Co. has awarded the contract for the erection of its plant to the Canadian Stewart Co., of Fort William. The plant will cost $750,000.

Sault Ste. Marie.—The Sault Dredging and Construction Co. of this city have been awarded the $90,000 contract for dredging the channel between Goat Island and Little Current on Manitoulin Island, to a depth of 22 feet.

Sault Ste. Marie, Ont.—The commercial portion of the city's waterfront is to be extended by the addition of a large dock and warehouse for the Standard Oil Company, the contract for which has been let to John Boyd, a local contractor. The dock will cost $50,000, and the warehouses and equipment will involve the expenditure of over $75,000.

Brantford, Ont.—The contract for the raising of Lorne Bridge several feet has been let by the Lake Erie & Northern Railway Co. The firm of Wright, Hazzard, & Cohen, Buffalo, are the contractors. The job is, perhaps, the most important one in the construction of the entire line, as it was this part of the route which required a special session of the Dominion Railway Board in this city. Work, it is said, will be commenced immediately.

New Incorporations

The Agricultural Implements Mfg. Co., Quebec, has been incorporated with a capital stock of $75,000 by F. C. Dufour, A. Bilodeau, L. Turcotte and others.

The Southern Canada Power Co., Montreal, has been incorporated with a capital stock of $3,000,000 by C. H. Cahan, O. B. MacCallum, M. Lewis and others.

Wood-Working

Hazel Dell, Sask.—C. A. Haines & Co., of Hazel Dell, Sask., have purchased the Hazel Dell sawmill, and are now operating it.

Weston, Ont.—The J. A. Manning Co. manufacturers of wood fibre, desire to erect a plant here. Inducements will be given the company.

Fort Qu'appelle, Sask.—The Fort Qu'appelle Boat Building & Woodworking Mfg. Co., capitalised at $50,000, will soon erect a plant at Fort Qu'appelle, Sask. George Grass, of Sintaluta, will be in charge.

Berlin, Ont.—The planing and lumber mills of Levi M. Bowman, near Heidelberg, eight miles north of here, were burned to the ground September 3. The loss is estimated at $4,000, partly insured. Mr. Bowman will rebuild immediately.

Wyoming, Ont.—Establishment of a box and basket factory, to employ from six to twelve men and boys, is being discussed. Mr. Dan. Senecal, carpenter and builder, now engaged in the general store business here, offers to start the business if the municipality will grant a bonus of $300, and an additional $100 to be contributed by subscription by the business men of the village. The Council will probably submit a by-law.

Crofton, B.C.—The Empire Lumber Co., Vancouver, B.C., contemplates erecting a lumber mill here.

Montreal, Que.—The sash, door and carriage factory of F. Tremblay & Co., at the corner of William and Richmond Streets, which was the scene of a $35,000 fire early on the morning of August 15, was again visited by a conflagration, which did damage to the extent of $5,000.

Railways—Bridges

Nelson, B.C.—The city already owns the electric light plant, and will, it is believed, shortly take over the street railway system.

Fort William, Ont. — The city will take over their end of the street railway this fall. Heretofore the city of Port Arthur controlled the street railway in Fort William.

Winnipeg, Man. — Steel is now laid for four miles along the route in the direction of the Stony Mountain, and grading has been completed for a considerable distance ahead of this.

Brantford, Ont.—Four miles of steel has now been laid from the Galt end of the Lake Erie & Northern Railway, and the grading has been done from Galt to a point two miles south of Glen Morris.

Calgary, Alta.—Engineer Carleton, of the Grand Trunk Pacific, announces that road will undertake the construction of a line through Moose Jaw, Medicine Hat and the Crow's Nest country into Southern British Columbia. The Calgary-Edmonton line will be extended south to make connections with the proposed line.

Sudbury, Ont.—Three miles of steel a day are being laid by the Canadian Northern Ontario Railway on its Sudbury-Port Arthur line in an earnest endeavor to complete this section, which is to connect the Eastern and Western Canada systems, by the end of the present year. According to official figures, there are only 180 miles to be finished.

Welland, Ont.—The Dunnville, Wellandport & Beamsville Electric Railway, which has been under construction for some years, but which lately has not been progressing on account of financial difficulties, is now about to be started again, arrangements being completed for the sale of extra bonds. Thirteen miles are already graded, and ties laid on this part of the road, the bridges and structural work being also completed on this division. The line has a charter from Port Dover to St. Catharines, with branches to Dunnville, Welland, Jordan Harbor and other points, making train connections with the G. T. R., Wabash, Michigan Central and T., H. & B.

Ottawa, Ont.—Three hundred men are thrown out of work as the result of a fire in the timber mill of the J. R. Booth industries here on September 7. Damage to the extent of $100,000 was caused by the blaze, the origin of which is a mystery. The mill destroyed was rebuilt only three years ago, new machinery being installed at the time.

Toronto, Ont.—Sir William Mackenzie, president of the C.N.R., has secured the money necessary for the fulfilment of the Pacific coast terminal plans, and they are to be put in effect without delay. Included in these plans are large yards and shops to be erected at Port Mann; terminal stations, etc., at Victoria and New Westminster, and at the City of Vancouver a project which involves an expenditure of $10,000,000, and which will take five years to carry out. The plans further called for making the railway's own entrance into Vancouver by way of a tunnel from New Westminster, the construction of which will cost in the neighborhood of $4,000,000.

Tenders

Welland, Ont.—Tenders have been called for seven buildings at an estimated cost of $150,000 for the new Union Carbide Co.'s plant to be erected here. The buildings include a cooling building, 60 by 180, storage building 60 by 220, packing building 77 by 140, mixer building 28 by 56, lime kiln building 66 by 380, with a lean-to 27 by 380, furnace building 77 by 340, office 60 by 270. All will be of brick, steel, iron and concrete construction, to make them practically fireproof.

Trade Gossip

The Elmira Machinery & Transmission Co., has recently changed its management.

Percy Ivy, manager of the International Malleable Castings Co., Guelph, Ont., reports a fairly brisk opening on fall orders.

J. T. Home received a contract from the Dominion Government on September 4 for dredging in the Rainy River at a price of $29,250.

The Millers' Supply Co., 321 King Street W., Toronto, who recently started in business, are carrying the beltings of Fleming, Birkby, & Goodall, Ltd., Halifax, England.

John Coates, a British gas expert employed by the city of Ottawa to report on the best way of establishing a municipal gas plant, is expected shortly to make known his findings.

Nova Scotia Steel Co. Output.—The August output of the Nova Scotia Steel & Coal Co. was: — Coal mined, 72,360 tons; pig iron made, 7,415 tons; steel ingots, 6,618 tons; iron ore mined, 54,654 tons.

Dominion Coal Co. Output.—The output of the Dominion Coal Co. for August amounted to 425,635 tons, as compared with 409,125 tons for the same period in 1912. The highest previous output was in October last, when 422,842 tons were mined.

The Lancashire Dynamo & Motor Co., of Canada, advise us that they have taken possession of their new premises at 107-109 Duke Street, Toronto, where they have greatly increased facilities for carrying a much larger stock than hitherto, thereby eliminating all possible delays in future shipments.

Dr. Dunn states that a group of his business associates contemplate the erection in Edmonton of a five-storey reinforced concrete building which will give accommodation for a number of small industries which are looking upon Edmonton as a favorable location.

The Abitibi Pulp and Paper Co., Iroquois Falls, Ont., have erected a thirty-room hotel for the mechanics who will instal and operate the half-million dollars' worth of machinery in the new plant being erected there. These are men belonging to a rather exclusive craft, and insist on being provided with the best accommodation.

Canada Iron Corporation.—The Montreal Trust Co. has been appointed provisional liquidator of the Canada Iron Corporation, succeeding F. F. White, who was named for that position by the court on August 21st last. Mr. White was taken ill at the end of last week, being compelled to abandon the work, and return to New York.

Dominion Customs Revenues.—Customs revenue for the Dominion still shows a steady increase. The receipts for August were $10,838,666, as against $10,147,908 for the corresponding month last year. This shows an increase of $690,757. For the five months of the present fiscal year, ended August 31st, customs revenue was $49,737,999, compared with $46,397,937 for the same period during the former fiscal year, an increase to date of $3,340,062.

Edmonton, Alta.—It is possible that in the near future Edmonton will have an industrial building for the housing of small industries similar to the building proposed for Calgary. Dr. W. C. Dunn, secretary-treasurer of the Wabamun Power and Coal Co., Edmonton, recently visited the industrial bureau in Calgary in search of information relative to industrial buildings, and looked over the plans for the proposed industrial building in that city, with which he was favorably impressed.

The Hare Engineering Co., Toronto, Ont., has purchased the designs, patterns, and patent rights of the Aiton Machine Co., New York City, manufacturers of wire cabling, stranding, insulating, armouring, braiding, spooling, winding, and measuring machines, etc.; also, the complete line of rubber-working machinery, including mixers, grinders, washers, calenders, vulcanisers, vacuum dryers, hydraulic and button presses. The Hare Engineering Co. have secured orders valued at $20,000 since taking over this plant. Among others, they have secured an order for a seven-reel stranding machine for the Canadian Wire & Cable Co., Ltd., Dundas Street, Toronto. Raymond Lewine, late of the Aiton Machine Co., will be manager of this end of the business. Offices will be maintained in Toronto and Buffalo, N.Y., and arrangements are being made for the manufacture of the foregoing lines, both in Canada and the United States.

The National Steel Car Co., Hamilton, Ont., has opened offices in the Shaughnessy Building, Montreal, with George Condon as representative.

Personal

W. R. Perrin, architect, Toronto, has been engaged by the city of Ottawa to give his opinion on an abattoir for the Capital.

J. A. Calder, superintendent of the Glace Bay, N.S., electric department, has tendered his resignation effective September 30th.

Andrew Strang, collector of customs of the port of Winnipeg, and one of its oldest residents, died on September 4, after a brief illness.

A. Copony has been appointed master car builder on the Western lines of the G. T. R., vice Mr. J. L. Hodgson trans-

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Brantford, Ont.—Plans have been prepared for an addition to the plant of the Hartley Foundry Co. on Canal Rd.

Brantford, Ont.—John Hall & Sons are about to add another addition to their plant for the manufacture of special machinery.

Montreal, Que.—The Canadian Tube & Wire Co., Ltd., Victoria St., will have plans prepared at once for the erection of a wire and rolling mill.

Guelph, Ont.—The Nokros Union Co. will manufacture their products in Guelph, Ont., and expect to be ready for business about November 1.

Hamilton, Ont.—It is reported that a Michigan iron concern, known as the Manistee Iron Company, may locate a Canadian branch in this city.

Montreal, Que.—The Imperial Wire & Cable Co., Montreal, has secured a permit for the erection of an eight-storey factory and office building. The cost is estimated at $1,500,000.

Welland, Ont.—The Dain Manufacturing Co., have decided to manufacture drills in addition to their other products. The plant will not be enlarged, but more hands will be taken on.

C.P.R. Shops.—President Sir Thomas Shaughnessy of the C.P.R., announced that large additions will be made to their shops in Montreal, and that $100,000 will be spent on new car shops at McAdam Junction, N.B.

Montreal, Que.—Large extensions are to be made on the C.P.R. Angus shops, which are to include the erection of two material shops, passenger car shops, freight car shops, bolt and nut shop, and extension to locomotive shops.

Berlin, Ont.—President Wendt, of the Buffalo Forge Co., Buffalo, N.Y., has completed negotiations for the establishment of the company's Canadian branch in Berlin. Five acres of Woodside Park property have been deeded to the company on which a foundry will be erected this fall.

St. Catharines, Ont.—The J. H. Williams Co., of Brooklyn, N.Y., manufacturers of lathe dogs, are reported to have purchased a building site for their plant, and will proceed with construction work in the course of a month or so. John Cotter will be the manager of the Canadian plant.

Toronto, Ont.—Hepburn & Fisher, Ltd., have been incorporated to manufacture structural steel at Toronto, with $150,000 capital. No plans have been made yet for a new plant, but this will be built in the near future. This particular section of the business has developed, together with that of John T. Hepburn, crane maker, having been started in June, 1912. The steel manufactured is principally for builders.

Sarnia, Ont.—The Cleveland Foundry Co., Cleveland, Ohio, have decided on Sarnia as the place at which they will erect their plant for the manufacture of oil cooking stoves, oil heating stoves, and cooking utensils. Options have been secured on sites in Point Edward and Sarnia. The company will invest over $200,000, and will employ 150 men at the start. The company is, it is understood, being financed by the Imperial Oil Co. F. E. Drury is president, and F. W. Ramsey manager.

Toronto, Ont. — The Moffat-Irving Steel Works, Ltd., who have been experimenting in the production of steel castings by means of an electric furnace for some months, have now reached a stage where they are open to receive orders for castings on a large scale. They have applied to the Toronto Harbor Commission for a site on which to build a large plant next year. The firm was recently incorporated in Ontario, with $100,000 capital. The principal shareholders are, J. W. Moffat, T. C. Irving, and Thos. R. Loudon, all of Toronto.

Toronto, Ont.—The John Inglis Co., Limited, engine and boilermakers, have prepared plans for the erection of a new plant on the old prison property, which is adjacent to a section of their present plant. The latter will be converted into a foundry, capable of making the largest castings. The new plant will measure 120 x 600 feet, and will comprise all departments to be found in an up-to-date general engineering works. The order for the steel has been given to a Montreal firm. Mr. Reaves is secretary-treasurer, and Wm. Inglis managing director.

Walkerville, Ont.—Berry Bros., varnish manufacturers, have partially completed an addition to their Walkerville plant. The total cost will be in the neighborhood of $15,000. The contract for the work was awarded to Wells & Gray, engineers, Toronto. The firm is a branch of Berry Bros., Detroit, Mich. The Walkerville plant was established some few years ago to handle the Canadian trade, and the rapid development has necessitated the enlargement that is now under way. The Seagrave Co., another Walkerville firm is preparing plans for another factory building. This firm is a branch of the Seagrave Co., Columbus, Ohio, and manufactures fire apparatus. The Walkerville firm has recently sold a fire steamer, auto-propelled, to the city of Windsor, at a cost of about $10,000.

Electrical

Carman, Man.—The Canada Tile and Fireproofing Co. will apply for a franchise to supply the town with electric light.

Elk Lake, Ont. — The Miller Lake-O'Brien Mine is developing the water power near Gowganda, on the east branch of the Montreal River, and will use the power electrically at the mine at Miller Lake.

Ancaster, Ont.—The village sent a deputation to Toronto last week to meet Hon. Adam Beck, and secure information regarding Hydro-Electric power. Arrangements may be made with Dundas to provide power.

Salmon, B.C.—A. H. Nairn, representing the contractor's setting up department and E. Hallgren, an expert from the builder's factory in Sweden, arrived here last week to set up the 200 h.p. Diesel oil engine, which will furnish the power for the city's electric light.

Toronto, Ont.—The Rice Hydra, Ltd., electrical contractors, 152 Bay street, have made an assignment to W. L. Martin A meeting of creditors will be held this week. The concern was a fairly large one, and had done some important work. The company will be reorganized under a new name.

Toronto, Ont.—To accommodate the many users of Hydro-Electric energy throughout the city, the Hydro Commission has found it necessary to build an addition to the transformer station on Strachan Avenue. The City Architect has issued the permit calling for the construction of a two-storey brick, steel and concrete building, costing $35,000.

Kingston, Ont.—The Department of Marine and Fisheries will erect a wireless telegraph station 300 feet northwest of Fort Henry for the purpose of forming a connecting link between Montreal on the east and Toronto on the west in a chain of stations reaching across Canada from Labrador to Vancouver. A site has been secured, and the work will be commenced shortly.

London, Ont.—The hydro-electric department will show a surplus of $40,000 by the end of November, the close of the fiscal year. For the first half, it was $20,000, and the last part of the year has seen a great increase of business. The consumers now number nearly six thousand, and the amount of power sold is nearly 6,000 horse-power. As a result of this surplus, power rates will be reduced next year. It is the intention of the commissioners to supply energy at a price as near cost as it can be furnished.

Municipal

Vegreville, Sask. — When the town has sold $56,000 worth of debentures, it will proceed to drill more gas wells.

Walkerville, Ont.—The burgesses voted on Sept. 6 on a by-law to raise $16,234 for cost of an incinerator plant.

Hamilton, Ont.—The city may purchase the gravel pit owned by Mr. McConnell, Waterloo Rd., Guelph, and instal a stone crusher.

Innisfail, Alta.—The by-law to raise by way of debentures $6,000 for the purpose of establishing an electric light plant has been voted on.

Bracebridge, Ont.—By-laws to raise $2,000 to provide for the purchase of site and right of way for a proposed rock crushing plant, and $10,000 to pay off floating debt of town were both passed recently.

General Industrial

Toronto, Ont.—Fire did $15,000 worth of damage at the Toronto Pottery Co.'s plant on Friday last.

Calgary, Alta.—The Keystone Portland Cement Co. propose to erect a plant at Blairmore, Alberta, to manufacture lime, brick and cement.

London, Ont.—The Rexall Drug Co., of Canada, will erect a $125,000 plant here or in Toronto. W. T. Strong, of this city, is vice-president of the company.

Essex, Ont.—The Windsor Pearl Button Co. will instal a branch plant here, with machinery, costing $7,000. It gets a free site, a $2,500 bonus, and exemption with free water.

Kincardine, Ont.—Fire on September 5 destroyed the three-storey grist mill belonging to J. W. Rea. The loss is between twelve and fifteen thousand dollars; insurance, $6,500.

Petrolia, Ont. — The Canadian Oil Companies, Ltd., are contemplating an enlargement of their plant which will double the output. New equipment is being bought for the wax works.

Toronto, Ont.—B. Oldstein has bought considerable property on St. Patrick Street, on which he will erect a factory. The property includes numbers 165-7-9 and 171, and was owned by J. W. Barry. The price paid was $18,000.

Nelson, B.C.—Authorization was given by the city council on August 26 to a committee, headed by Mayor Keefe, to make a definite proposition to the Nelson Gas and Coke Co. for the purchase of that corporation's plant here.

Sherbrooke, Que.—The agreement between this city and the Panther Rubber Co., has been signed. The company gets exemption from taxes for a period of years. The company agrees to spend $25,000 in wages during the first year, and increases this amount as time goes on.

Calgary, Alta.—A syndicate of local and Minneapolis capitalists will shortly commence the erection of what it is claimed will be the largest flour mill in the British Empire. It will be built in four units, to cost $1,400,000 each, and, when all the units are completed, will have a capacity of 6,000 barrels of flour per day. Work on the first unit will be commenced immediately.

Cobalt, Ont.—By the installation of a large tube mill and other changes at the O'Brien concentrator, the capacity of that mill will be increased from 100 tons to 150 tons. The changes are now being made, and it is expected that 150 tons will be treated in the mill before the end of October. No change is being made in the cyanide process, which has been in use for several years at the mill.

St. Catharines, Ont. — The Rice-Hulbert Shoe Co., of Courtland, N.Y., has decided to establish a Canadian branch of its concern in St. Catharines. A site has been purchased on the Western Hill near the Grand Trunk Railway, and tenders are being called for a two-storey brick building, which will be followed by another after the first is completed. The company expects to be employing 150 hands early in the winter.

Sault Ste. Marie, Ont.—The commercial portion of the city's water front is to be extended by the addition of a large dock and warehouse for the Standard Oil Co., the contract for which has been let. The dock will cost $50,000, and the warehouse and equipment will involve a further expenditure of over $75,000. Provision will be made for docking the largest of the vessels of the Standard Oil Co.'s fleet, which convey the oil in bulk to Sault Ste. Marie.

Refrigeration

Ottawa, Ont.—The city is contemplating the erection of a civic abattoir.

Toronto, Ont.—The American Club is having a 1-ton "York" refrigerating plant installed.

Engleton, Ont.—Joseph Kilgour's residence is being equipped with a 3-ton refrigerating plant, furnished by the Frick Co., Waynesboro, Pa.

Toronto, Ont.—St. Augustine Seminary is being equipped with a 6-ton refrigerating machine, furnished by the York Manufacturing Co., York, Pa.

Niagara Falls, Ont.—Frank Douglas and Henry Campagne are considering the establishment of a cold storage plant here. The estimated cost is $50,000.

Prince Albert, Sask.—The Saskatchewan Abattoirs, Ltd., is preparing to erect a cold storage and packing plant. James O'Callaghan is the managing director.

Vonda, Sask.—The Canadian Government has awarded the contract for construction of a warehouse with cold storage facilities at Vonda, designed especially for storage of meats.

Niagara Falls, Ont.—The Douglas Pure Ice Co. is erecting a new structure, to be equipped with machinery for the manufacture of ice. A 75-ton or 100-ton plant, it is stated, will be installed.

Berlin, Ont.—M. B.Rickert has purchased one 2-ton vertical single-acting belt-driven enclosed type refrigerating machine and high pressure side, complete, from the York Mfg. Co., York, Pa.

Toronto, Ont.—C. White & Co. are installing an 8-ton vertical single acting belt-driven enclosed type refrigerating machine and high pressure side complete, supplied by the York Mfg. Co., York, Pa.

Vancouver, B.C.—The Mainland Ice & Cold Storage Co., who are building a new cold storage house, have let the contract for installation of direct expansion piping for same to the Frick Co., Waynesboro, Pa.

International Amphitheatre, CHICAGO
OCTOBER 10-17

Will Bring Home The Bacon

Ideas you need in your business and **Information** regarding new tools and methods that will enable you to outstrip your competitor will result from your visit to this great business convention.

The following partial list of exhibits gives some idea of the scope of the display :

Classification of Exhibits

Abrasive materials.
Adding machines.
Air compressors.
Belt lacing machines.
Blastmeters.
Blowers, cupola.
Boring machines, vertical.
Boring machines, horizontal.
Boring mills.
Broaching machines.
Carborundum products.
Cars, industrial.
Chain blocks.
Chucks, drill.
Chucks, lathe and planer.
Clutches, friction.
Controllers, electric.
Converters, steel.
Core machines.
Core ovens.
Cranes, electric.
Crucibles, retorts, etc
Cupolas.
Cutters, gear and milling.
Cutting-off machines and tools.
Cutting, oxy-acetylene.
Drill grinding machinery.
Drill presses, multiple spindle.
Drilling machines.
Drills.
Drills, radial.
Dust collectors.
Dynamos.
Electrical supplies.
Electro-plating machinery.
Electro-platers' supplies.
Elevators, electric.
Fans, electric and exhaust.
Factory construction material.
Fire-brick, cupola block.
Flasks, aluminum, iron, wood.
Foundry equipment, iron, brass.
Foundry supplies, etc.
Furnaces, melting.
Furnaces, annealing and tempering.
Furnaces, electric.
Gear cutting machines.
Gear hobbers.
Graphite.
Grinding tools.
Grinding wheels, alundum.
Grinding wheels, carborundum.
Grinding and polishing machinery.
Grinders, disc and surface.
Grinders, plain and universal.
Hack saw machines, power.
Hoisting and conveying machinery.
Hoists, electric, pneumatic.
Hoists, portable.
Ingot metals.
Keyseaters.
Ladle heaters.
Lathes, engine and turret.
Lathes, wood and pattern.
Lubricants.
Mch. shop tools, supplies.
Matchplates.
Milling machines, horizontal and vertical.
Mold dryers.
Molding machines, automatic.
Molding machines, hand and power.
Motors and generators.
Pattern shop machinery.
Pattern and box lumber.
Pig iron.
Planers.
Pneumatic tools.
Polishing and plating machinery.
Pulleys, metal and wood.
Punches, power and hand.
Pyrometers.
Radial drills.
Riveters, pneumatic.
Sandblast machinery and equipment.
Sandblast accessories.
Sand mixing machinery.
Saw sharpening machines.
Screw machines.
Separators, magnetic.
Shapers.
Slotters.
Sprue cutters.
Tool room grinders.
Track, industrial.
Tramrail systems.
Trolleys.
Trucks, hand and electric.
Turret machines, vertical.
Turntables.
Vertical turret lathes.
Vibrators.
Welding machines, oxy-acetylene.
Welding and cutting compounds.
Woodworking machinery.

Coincident with the exhibition will be held the Annual Conventions of the Allied Foundry Associations. Many valuable discussions that no progressive foundryman can afford to miss are on the program.

The Chicago Committee is providing special entertainment for the visiting foundrymen and their friends.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers. We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish steel stampings in Nickel, Brass or Copper. Send us a sample order.

W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

Water-Works

London, Ont.—The city has finished the drilling of four artesian wells at a cost of $100,000. They yield 2,500,000 gallons per 24 hours.

Mirror, Alta.—The G. T. P. Railway will construct a pipe line between its water tank here and Buffalo Lake, anr will supply the town. A pumping station and reservoir will be built, the whole scheme costing $15,000.

Building Notes

Toronto, Ont.—The Home Suite Home Co., Ltd., will erect an apartment house with 400 rooms, costing $175,000 at 121 Carlton street, at once.

London, Ont.—John Griffin, of Toronto, has secured a fifty-year lease property on which a new $100,000 popular vaudeville playhouse will be erected.

Sherbrooke, Que.—The contract has been let for building the new part of the Sherbrooke General Hospital. The additional buildings will be fireproof, brick and stone, with cement floors, and are to be completed by March 1st. Loomis-Dakin, Ltd., are the successful contractors.

Catalogues

The Fosdick Machine Tool Co., Cincinnati, O., have sent us a copy of circular illustrating and describing their 36 in. heavy duty radial drill. A complete specification is given of the machine.

The Department of the Interior, Bureau of Mines branch, of the U.S. Government, has issued Miners' Circular No. 12 entitled, "The use and care of Miners' Safety Lamps," which contains a lot of useful information for those engaged in the mining industry.

The Standard Electric Tool Co., Cincinnati, Ohio., have recently issued bulletins D.9 and D.A.10, the former describing the "Standard" D.C. portable electric drills, and the latter being devoted to A.C. portable drills. A specification is given of each type, together with capacities, speeds, etc.

The Department of the Interior, Bureau of Mines branch, of the United States Government, has published bulletin No. 61, entitled "Abstract of Current Decisions on Mines and Mining." This publication contains abstracts of legal decisions of all the Federal and State Courts on questions relating to the mining industries.

Precision Tool Works

Tool-makers to their Majesties the Canadian Manufacturers.

Special:—Collets, Box Tools, Circular forming tools.

Special taps and thread· U.S.A. Acme; or Square for tapping. Cast Iron, Steel, Brass or Copper.

Special Threading Dies, Spring Button or Solid.

We have sixteen years practical experience in a great many different shops on a wide range of Tool and Die work which you get the benefit of by consulting us in regard to any special tools you may need.

SECOND HAND MACHINERY FOR SALE

JUST AS YOU were attracted by the Caption "Second Hand Machinery for Sale," so will hundreds of other men all over Canada.

WHY NOT ADVERTISE that machine of yours that is getting too small or that isn't quite suited to the work for which it was intended?

Let "CANADIAN MACHINERY" find a buyer for your machinery or let it find you a second hand machine if you need one. Let "CANADIAN MACHINERY" connect you with good men if you are looking for them or with a better job if you desrve one.

Let it sell for you or buy for you, be it a factory or a machine, a man or a job.

"CANADIAN MACHINERY" is the Market Place for Machinery and Metal Men. Come to it if you wish to buy or sell.

Rates for a stand in the Market Place are 2c per word first insertion, 1c per word each subsequent insertion. Each figure counts as one word.

CANADIAN MACHINERY
143 University Ave., Toronto

One Superintendent and Advertising

¶ The superintendent of one of the largest industrial concerns of its kind in Canada, in talking to our representative last week, made a statement that ought to encourage every advertiser of machine shop and metal working machinery.

¶ This is what he said:

¶ "In equipping our plant we consulted the advertising pages of the technical and trade papers. We thoroughly believe in advertising and constantly turn to it for information when in need of equipment."

¶ Turning to an eighth-page ad. in "Canadian Machinery's" Hints to Buyer's Department, he continued:—

¶ "Take this little ad. about safety set screws, for instance, I was looking over the advertisements one day and this set screw appealed to me. As a result, our entire plant was equipped with them."

¶ The above is a true report of an actual occurrence and is not an imaginery incident worked out by a straining mind hard pressed for facts. It is true in substance, and we will furnish the name of the superintendent and the name of the concern to those who want it.

¶ The incident mentioned has a double tracked moral and can be travelled by both the purchaser and the manufacturer of metal working machinery.

¶ The moral for the purchaser, for the master mechanic, the superintendent and the foreman, is that if the busy superintendent of the largest and best equipped plant of its kind in Canada takes time to study the advertising pages of "Canadian Machinery," he must find it both profitable and expedient.

¶ The moral for the manufacturer stands out like a thistle in a thumb, and it is **A-D-V-E-R-T-I-S-E.**

Rate Card and full information gladly furnished

Canadian Machinery & Manufacturing News

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.

143 University Avenue, TORONTO

ferred. His headquarters are at Port Huron, Mich.

Stanley Eisenhoffer, of the Toronto Hydro-Electric office staff, has been appointed superintendent of the underground wiring system of the Hydro-Electric at Hamilton.

W. E. Forbes has been appointed manager of the Dain Manufacturing Co.'s plant at Welland, to succeed Mr. Arbenz, who has accepted a position with the John Deere Plow Co.

George Thompson, contractor, while working on the new Cole Bridge in the course of erection near Linden, Ont., on September 4, fell and injured his left side, and almost severed his left thumb.

H. W. Hutchinson, president of the Canadian John Deere Plow Co., was the guest recently of the Regina implement dealers. The occasion was the opening of the big John Deere warehouse at that point.

Otis Funderburk, formerly Michigan manager for the Rayfield Carburetor, has been appointed sales manager of the carburetor division of the Detroit Lubricator Co., who are making and marketing the "Stewart" Carburetor.

Capt. James Reid, president of the Reid Wrecking Co., of Sarnia, died on September 2, in Detroit. For over forty years he had been the most dominant figure in the wrecking annals of the Canadian Lakes marine.

E. Carnegie, of London, Eng., secretary-treasurer of the Electric Steel and Metal Co., Welland, Ont., and W. L. Renton, a director, of Edinburgh, Scotland, will move to Welland, and will take part in the management of the plant.

Raymond Lewine, for fifteen years associated with the Aiton Machine Co., of New York City, has accepted a position as manager of the wire and rubber machine department of the Hare Engineering Co., of Toronto, who have purchased the designs, patterns, and patent rights of the above company.

J. O. Sharp has entered action against the Meaford Brick Co., for $50,000. He claims that he had a three-year contract with the brick company at $5,000 a year. Of the amount claimed, $11,250 is for salary, $17,000 for percentage, and the balance for alleged damages to his business reputation.

R. A. Ross, Montreal, who was engaged by the city of Toronto to value the electric light franchise and assets of the Toronto Electric Light Co. and Toronto Street Railway Co., has been asked by Mayor Hocken to hurry his report, as the matter must be submitted to the ratepayers before January 1.

F. F. White, who was recently appointed provisional liquidator for the Canadian Iron Corporation, has been very ill lately, which may necessitate some new arrangement for the direction of that company's affairs under the application made to the courts. Mr. White returned to New York at the beginning of last week.

W. A. Martin, formerly general manager of the Toronto Electric Light Co., with which he was connected for 23 years, and recently managing director of the Canadian British Engineering Co., Toronto street, Toronto, has taken over the Ontario end of the latter business, and will open premises at 70 Lombard St., Toronto, with a stock of tool steel, belting, etc.

Clark Evans Fisher, member of the recently incorporated firm of Hepburn & Fisher, Ltd., structural steel makers, Toronto, was for twelve years with MacGregor & MacIntyre, structural steel makers, Toronto, and was for a time secretary of the company. He left them in June, 1912, to manage the structural steel end of the John T. Hepburn Co. business, and has now been taken into partnership.

A. A. Dion, of the Ottawa Electric Company, was elected president of the Canadian Gas Association at their annual meeting, held in Toronto last week. Their officers are: First Vice-President, Howard Mann, Montreal; Second Vice-President, R. A. Wallace, Quebec; Executive Committee, J. S. Norris, Montreal; J. M. H. Young, London; J. P. Kay, Stratford; Arthur Hewitt, Toronto; Secretary, John Keillor, Hamilton.

John MacMillan has been appointed manager of the Toronto branch of L'Air Liquide Society in place of Mr. Parrington, who was drowned at Woodbine Beach, near Toronto, some weeks ago. Mr. MacMillan was formerly a traveler for the parent firm at Montreal. He is a native of Glasgow, Scotland, where he acquired considerable engineering experience before coming to this country. Mr. MacMillan will superintend operations at the new Oxygen plant which L'Air Liquide Society is building on Boler street, Toronto.

◆

To solder steel to cast iron, first copperize the cast iron surface with vitrol. It is necessary that the cast-iron surface be thoroughly cleaned and polished before the vitriol is put onto it. After having applied the vitriol, allow the surface to dry thoroughly and then solder the steel to the copperized surface, the same as in ordinary soldering.

DEMAND FOR ELECTRICAL APPLIANCES.

THE increased activity in electrical engineering throughout the world has naturally caused an enormous advance in the demand not only for machinery, but also for materials such as lamps, batteries, and other sundries, but it is rarely realised how much the expanding trade in these goods has been to the benefit of firms handling British lines.

For instance, the annual purchases of British electrical goods, exclusive of machinery, by Australia have risen within five years from £350,000 to £858,000; in the case of India, from £223,000 to £330,000; South Africa, from £99,000 to £307,000; New Zealand, £78,000 to £153,000; and Canada, £49,000 to £278,000; while the demand on behalf of countries outside the empire is hardly less remarkable, as exemplified by Japan, which last year purchased British electrical goods, exclusive of machinery, to £375,000, against £126,000 in 1908; Egypt, £395,000, compared with £23,000 in the former period; the Argentine, £268,000, contrasted with £148,000; and Brazil, £167,000, against £86,000. Even the United States, strange as it may seem, last year bought British goods of this class to no less than £169,000, against only £9,000 five years ago. These figures are significant of a pronounced preference for the high quality of British goods, and make a forcible contrast with the situation only a few years ago when American and German productions of this kind practically monopolized the markets of the world.—British Export Gazette.

TOOL GRINDING WITH NORTON WHEELS

Alundum Wheels are widely recognized as the unequalled grinding wheels for sharpening steel tools—a reputation that increases with each passing year.

WHAT OTHERS SAY—

"A very cool, free-cutting wheel; works well dry without burning"—on small high-speed steel tools.

"Hold their shape and cut the steel either red hot or cold"—in the manufacture of air-hardening steel tools.

We make Alundum Grinding Wheels of regular or special temper to meet every tool sharpening requirement. Let us prove it to you.

The Canadian General Electric Co., Ltd., Toronto, have sent us a bulletin entitled, "When your ship comes in," which describes fully the long life flame arc lamp, type W, which is specially constructed for use on wharves, docks, and railroad terminals, or in any place exposed to the weather. Copies of this bulletin may be had on application.

The Herbert Morris Crane and Hoist Co., Ltd., Toronto, have sent us a leaflet, illustrating various installations of the Morris "Q.E.F." runways and chain blocks, which indicate the scope and usefulness of such equipment. This firm are large makers of chain blocks, and will be glad to send, when requested, the monthly stock list, and also copies of the above leaflet.

The Hjorth Lathe & Tool Co., Boston, Mass., have favoured us with a copy of their catalogue setting forth the details of construction of the Hjorth precision lathe. The screw-cutting, milling, slotting, and other attachments supplied with the lathe are very clearly illustrated by excellent half-tones. The Canadian agents for this lathe are the Foss & Hill Machinery Co., 344 St. James Street, Montreal.

The Canadian Morehead Mfg. Co., Woodstock, Ont., have published an interesting booklet containing a lot of valuable information for steam users. Among the subjects treated are live and exhaust-steam heating, radiation, steam traps, etc. Several useful tables are included on steam heating, pipe factors, H.P. of belting and pulleys, factors of evaporation, etc. The booklet is printed in clear type and bound in cloth boards, pocket-size.

Willmarth & Norman Co., Grand Rapids, Mich., have sent us a series of leaflets, in loose leaf form, describing the "New Yankee" drill grinders and the "W. & M." surface grinders, etc. The leaflets contain illustrations and specifications of each type of machine, together with a description of the principal features, also code words and price lists. The sheets are got up in very handy size and form. Copies will be gladly sent on request.

Bruce Peebles & Co., Ltd., Edinburgh, Scotland, have sent us a copy of pamphlet No. 18B, which deals exclusively with "Peebles" continuous current dynamos and motors of the standard open type. The principal features of this type of machine are fully described and clear illustrations given. The pamphlet contains several tables giving the h.p., k.w. and speeds of the various sizes, in addition to other tables giving the principal frame dimensions and weights. The pamphlet is set in clear type, and copies will be sent to interested readers.

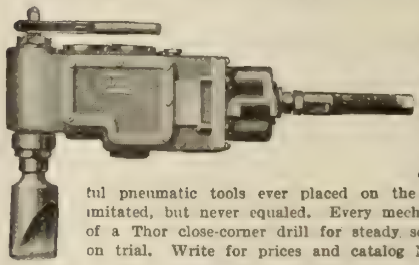
Thor CLOSE-QUARTER PISTON AIR DRILLS



Are the original Nos. 8 and 9 motors for close-corner work. The neat and compact construction of these drills, together with the design of the mechanical parts, have resulted in their becoming the most successful pneumatic tools ever placed on the market. They are often imitated, but never equaled. Every mechanic appreciates the value of a Thor close-corner drill for steady service and economy. Sent on trial. Write for prices and catalog No. 9.

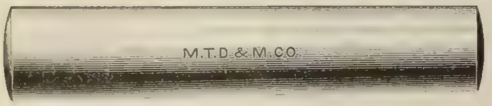
Radial Drills and Lathes Cincinnati, Ohio

"MORSE"



TAPER PINS AND REAMERS

Are noted for the High Quality conspicuous in all "Morse" Products

Our TAPER PINS are accurate to gauge and have a smooth, polished surface. Are nicely finished. Taper ¼ in. per foot. They fit holes reamed with our TAPER PIN REAMERS of which we make three styles.

Every motor car manufacturer and repairer should use "MORSE" Taper Pins and Reamers. They are a necessary part of their establishments.

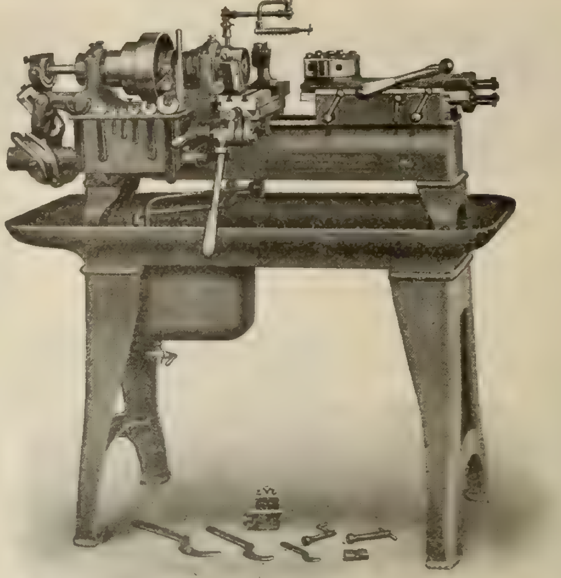
Twist Drills, Reamers, Milling Cutters, Etc.

Send for illustrated Catalog —it contains much to interest you and is free for the asking.

Morse Twist Drill & Machine Co.

NEW BEDFORD, MASS.

"Morse" Drills and Tools are handled by:—Rice Lewis & Sons, Limited, Toronto; Aikenhead Hardware, Limited, Toronto; Frothingham & Workman, Montreal; Mechanics Supply Co., Quebec.



You get fast production because—

The operator has full control in two levers that he can manipulate quickly.

Handy control, due to semi-automatic design, is a feature of

B. & S. Wire Feed Screw Machines

The lever shown at the upper right-hand side of machine controls movement of turret slide. Turret revolves automatically to bring each consecutive tool into position, and an automatic lock firmly secures turret when turret slide is advanced.

The large lever extending down from cross slide operates forming and cutting off tools. A dog on cross slide trips chuck and wire feed mechanism as piece is cut off, causing new length to be fed.

If interested ask us for further information about Nos. 0 and 1 Wire Feed Screw Machines. Special circulars on request.

Broken Tangs? Use "Perfect" Double Tang Sockets

What do you do with broken tang drills, otherwise in good shape? With the "Perfect" Double Tang Socket all you have to do is to grind a new tang on the shank below the old one, slip the drill into the socket, and you have practically a new drill—and all done in two to three minutes' time. The new tang is 25 to 60 per cent. stronger.

Folder 19-C gives complete details.

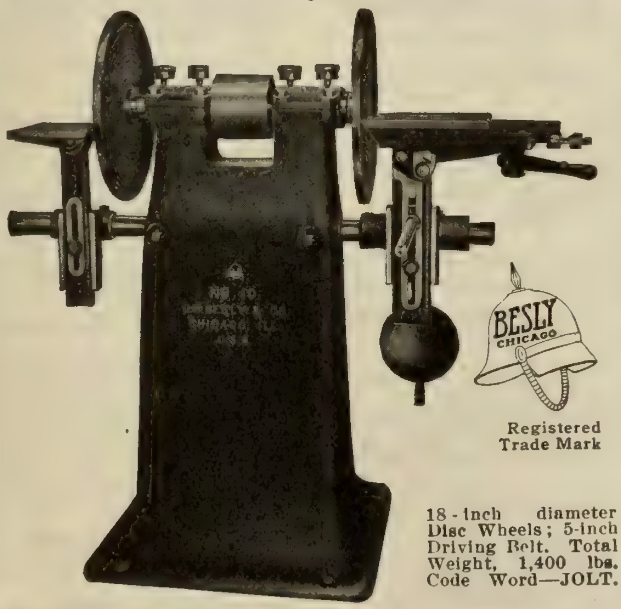
The World's Most Popular DISC GRINDER



BESLY
CHICAGO

Registered
Trade Mark

18-inch diameter Disc Wheels; 5-inch Driving Belt. Total Weight, 1,400 lbs. Code Word—JOLT.

NO. 10-18.—C. BESLY GRINDER.

For general Fitting and Finishing, and Manufacturing operations, requiring 18-in. diameter disc wheels.

One of the most useful tools known to machine shop practice.

Costs only Six Cents a Day for Interest on Investment.

Ask us for Details.

Who Needs a Lathe?

¶ A good many concerns sell lathes.

¶ Many good concerns sell lathes and sell them in a modern way.

¶ The concerns that sell lathes in a modern way sell modern lathes

¶ *A modern lathe is what you need.*

¶ Get in touch with the sellers of modern lathes by consulting this Directory. Look under Lathes.

¶ If you don't need a lathe you may need something else. Use this directory.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

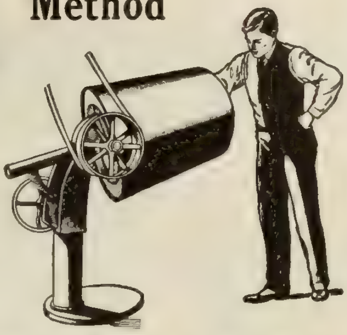
The Modern Method of Tumbling

As it is being practiced to-day by thousands of the largest shops in the country can be summed up in the three words—



GLOBE TUMBLING BARRELS

These barrels have completely outclassed the horizontal barrel from every standpoint. They can be filled or emptied and the work inspected while the barrel is running. No need to stop them—not even to switch from gentle to violent tumbling.

8 stock sizes—$50 to $170. Get our new catalog 2 and read how Globe Barrels will help you.

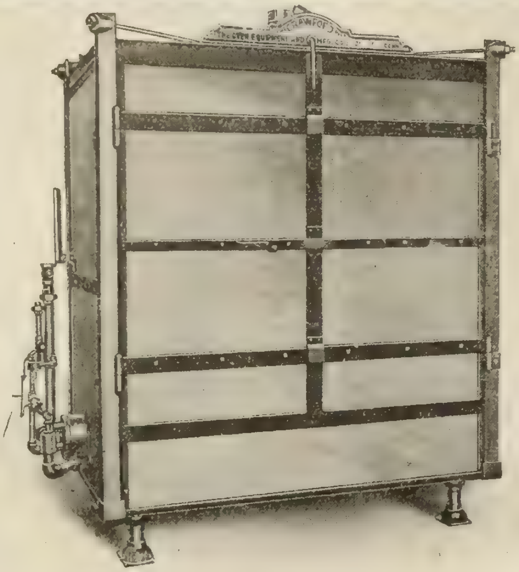
THE OVEN EQUIPMENT AND MFG. CO. NEW HAVEN, CONN.



FIRST AID

in japanning, enameling, lacquering, bluing and drying is the proper sort of oven in which to carry on these operations.

The Crawford Sectional Oven

is in a class by itself in providing perfect uniformity of temperature subject to ready control and complete combustion of the gas.

Highly efficient insulation reduces heat leakage to a minimum, while the positive pressure blower provides the necessary circulation of air for perfect combustion and maximum fuel economy. And don't forget the

ENCLOSED FLAME GAS BURNER

These ovens are made for any size of work. Trays on roller bearings, used for small cores, make handling easy. As the oven is sectional, it may be made in any size and with any combination and arrangements for operating.

Let us figure on your requirements. Meantime, let us send you our booklet C.

"SLY" Sand Blast Mill

Introduces an Up-to-date and Economical Method of Cleaning Castings

This is a simple, massive, solidly constructed machine with large wearing surfaces. Barrel is of steel 1 inch thick.

Sand and dust are thoroughly separated at an enormous saving of time and labor. Blasting sand is automatically returned to the nozzle for continued rise.

1 to 2 H.P. is sufficient for operation, as the balance of the machine is perfect. **"Sly" Sand Blast Mill** can be adjusted while it is in operation.

The Sly No Wear nozzle is of such design as to keep constant the same consumption of air at all times.

Cleaning Mills—Cinder Mills—Rosin Mills—Dust Arrestors.

It will be to your interest to get our catalog—a card will bring it to you.

Complete Sand Blast Rooms and Equipment a Specialty

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

Sand Rammer in operation.

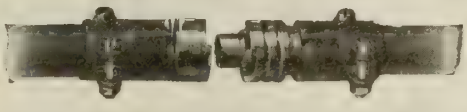
CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.



Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock: — RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

Little Giant

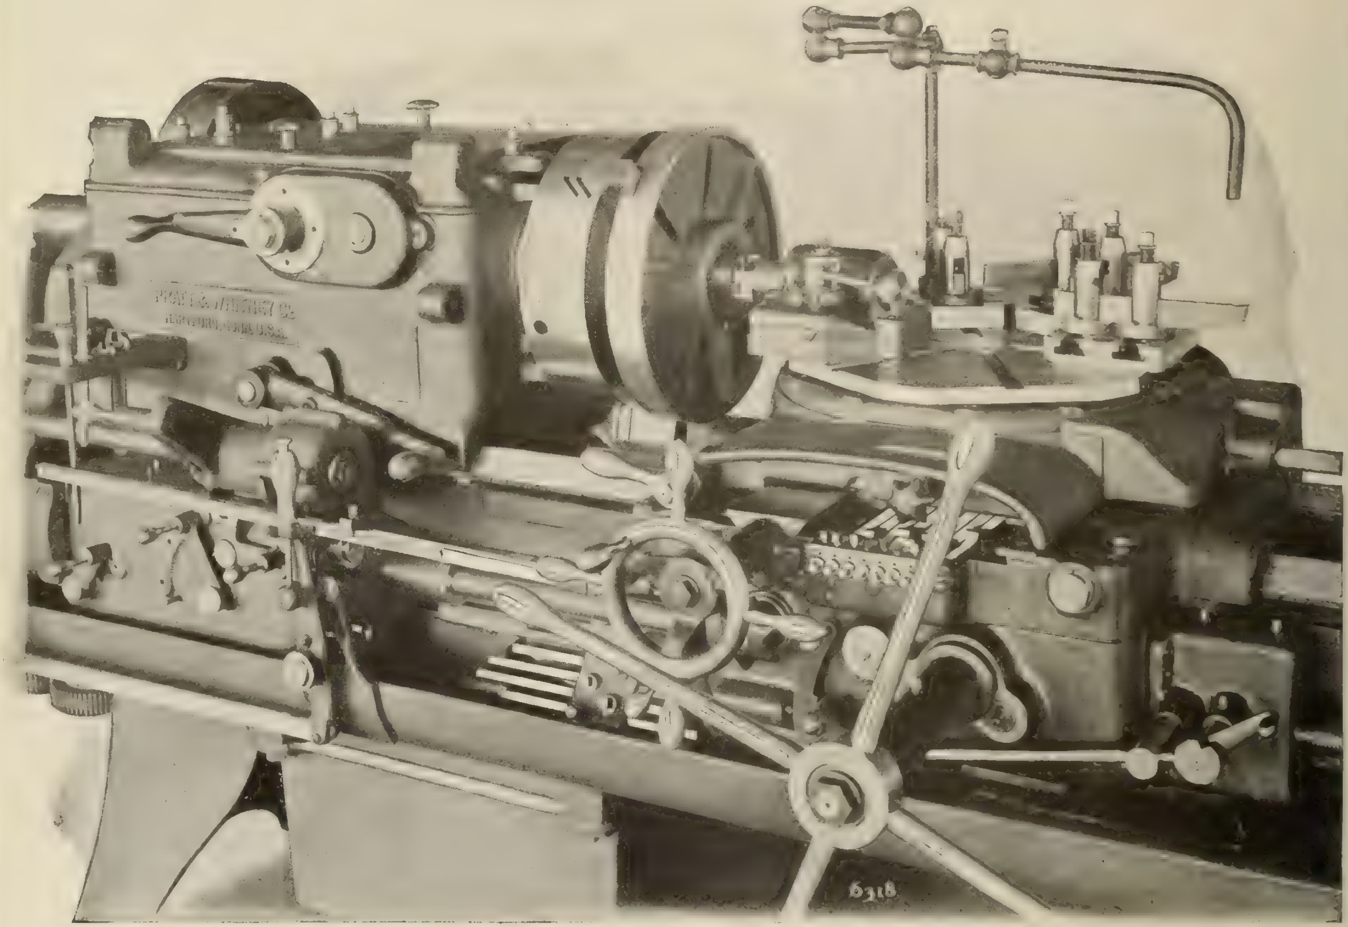
Here's a Simple Tool Equipment For Finishing Castings—

Including Threading



P. & W. Turntable Lathe

With threading attachment which may be furnished. Work is machined and threaded at one setting assuring absolute concentricity of threads and machined surfaces.

Operator Has Complete Control While Watching Work

A glance will show that the operator has complete control of the machine, including speeds, feeds and threading attachment, without taking his eyes from the work. Note how accessible and how easily all the stops are adjusted.

Ample rigidity and power enable the operator to take heavy roughing cuts and accurate finishing cuts. This in conjunction with convenience of operation assures maximum output and a first class finish.

Rigid, Quick Operating Threading Attachment

The threading attachment furnished for the P. & W. Turntable Lathe combines speed with extreme rigidity, being a part of the machine itself. A separate train of gears is used for threading and the feed and threading mechanisms cannot be engaged at the same time.

The tool slide may be clamped rigidly to the turntable directly under the tool. Automatic stops are provided in both directions and the tool is returned at high speed.

Send drawings of your chucking and rod work—we shall be glad to advise you as to output, necessary tool equipment, etc.

ACCURACY

Accurate, high grade Cap and Set Screws should contain the following essentials:

1st.—Best Material.

2nd.—Uniformity of thread depth.

3rd.—Pitch accuracy.

4th.—Concentricity of thread with body.

5th.—Parallel sides of heads.

Galt Screws have all of the above cardinal points of quality. Try them and be convinced.

Big stock of Finished and Semi-finished Hexagon Nuts.

16 in. Lever
POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

Speed of countershaft for average **work, 300 per minute.**

EFFICIENCY

¶ Efficiency is the curtailment of needless expenditure of money. The working out in a broad way of the old maxim, "A penny saved is a penny earned."

¶ Standardization is the keynote of efficiency in power transmission equipment.

¶ We offer you a complete standardized line of "Everything for the Mechanical Transmission of Power," embodying the split feature throughout, and interchangeability wherever practicable, a line that has been designed to minimize the cost of erection and maintenance.

¶ That we may serve you with dispatch, we maintain immense stocks at Toronto and Montreal which are supplemented by our chain of stock carrying agents extending from coast to coast.

¶ Start your efficiency program to-day. Get in touch with our expert transmission engineers. Their services will cost you nothing.

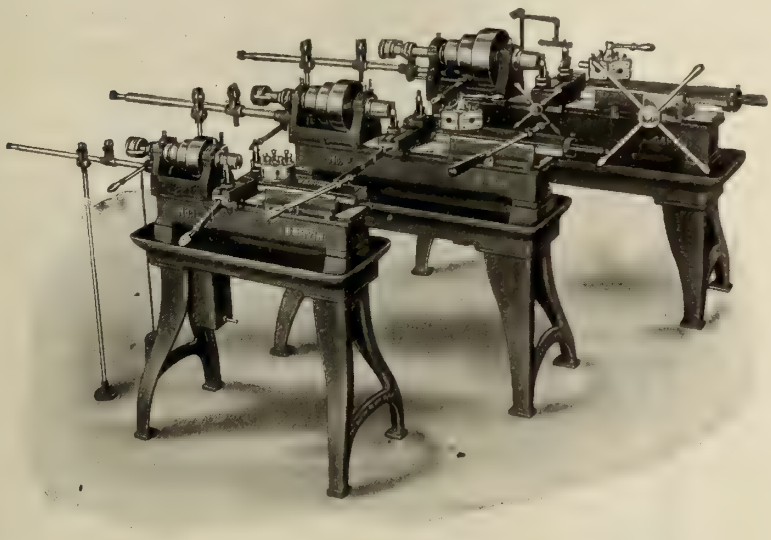
Garvin Screw Machines

GIVE UNSURPASSED SATISFACTION

The best materials are used in manufacturing these machines. Parts made of Krupp Chrome Nickel Steel, Drop Steel Forgings and Vanadium Steel Springs. Absolutely no steel castings used. Machines can be realigned under all conditions of wear. Spindles are of large diameter, bearings are ground and run in bronze boxes. Cross-slides fitted with plug stops, capable of fine adjustment, and can be lifted from bed without removing turret base. Hexagon Turrets on all machines, except the No. 1. Independent stops to each of the six turret holes. Our turrets and slides have long been renowned for their rigidity without cumbersomeness, the result being large output. The turret momentum is stopped by a solid plug, the lock bolt being used for indexing only. Many other exclusive features.



Garvin Nos. 1, 2, and 2½ Screw Machines, Wire Feed

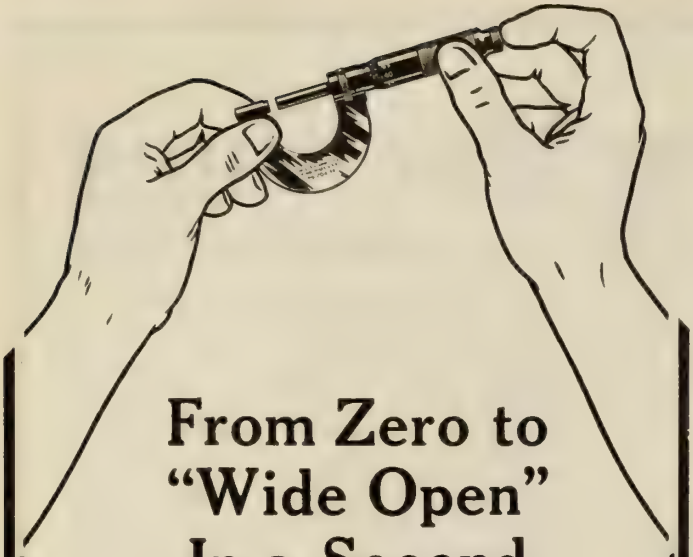
THE GARVIN MACHINE CO.

Spring and Varick Streets - - - 45 Years In NEW YORK CITY

MANUFACTURERS OF

Universal, Plain, Hand, Vertical, Duplex, Profile and Vertical Spindle Milling Machines; Surface, Hole, Cutter and Tool Grinders; Die Slotters; Screw Machines; Monitor Lathes; Automatic Chucks; Screw Machine and Milling Machine Tools and Attachments; Automatic, Horizontal and Vertical Tapping Machines; Duplex Horizontal Drills; Gang Drills; Hand Lathes; Screw Slotting Machines; Spring Coiling Machines; and Special Automobile Machinery, Etc.



From Zero to "Wide Open" In a Second

You are probably used to a "mike" which you have to turn forty times in order to open one inch. It's slow work if you're in a hurry, and it isn't in line with modern ideas of shop efficiency. We have solved the problem of quick micrometer adjustment without sacrificing accuracy with the

Starrett
Quick-Acting
Micrometer

This micrometer has a plunger which when pressed releases the nut from the screw and permits rapid adjustment. When the setting is made approximately, the plunger is released and, if necessary, a more accurate setting made by turning slightly in the usual manner.

Now we believe if you're an up-to-date machinist you need this micrometer. It was designed for up-to-date men.

If you aren't familiar with it look it over at the nearest hardware store and send for catalogue No. 203. It contains other tools that you really need.

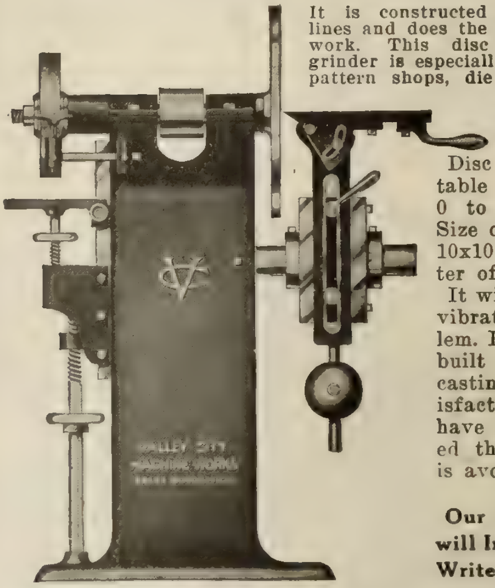
No. 9 Disc and Surface Grinder

Here is the Machine That will Meet *Your* Requirements.



It is constructed on practical lines and does the finest kind of work. This disc and surface grinder is especially adapted for pattern shops, die makers, and all kinds of tool and surface grinding.

Disc side has table tilting from 0 to 43 degrees. Size of disc table, 10x10 in. Diameter of disc, 18 in. It will solve your vibration problem. It is strongly built of one solid casting; and satisfactory tests have demonstrated that vibration is avoided.

Our Catalogue will Interest You. Write for it now.

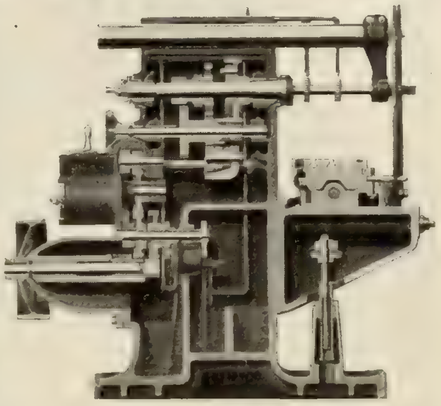
WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 6
Lubricating System

The importance of the lubrication of a milling machine cannot be over-estimated. It is a point on which the prospective buyer should thoroughly satisfy himself.



The lubricating system of Milwaukee Millers (see sectional view) consists of a reservoir in the base of the machine, holding several gallons of machine oil which is pumped to the top of the machine and distributed by a perforated pipe, cascading downward over all the gears and bearings on its way back to the reservoir.

In ordinary construction the oil is held stagnant in closed grooves. In our machines clean oil cascades continuously and rapidly over the bearings through open grooves. This washes away foreign substances which cause heating and cutting.

These "WHYS" in favor of Milwaukee Millers which we publish every week are merely concrete facts taken from our Bulletins. Shall we mail you your copies?

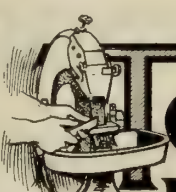
NORTON



TOOL GRINDING WITH NORTON WHEELS

Alundum Wheels are widely recognized as the unexcelled grinding wheels for sharpening steel tools—a reputation that increases with each passing year.

WHAT OTHERS SAY—

"A very cool, free-cutting wheel; works well dry without burning"—on small high-speed steel tools.

"Hold their shape and cut the steel either red hot or cold"—in the manufacture of air-hardening steel tools.

We make Alundum Grinding Wheels of regular or special temper to meet every tool sharpening requirement. Let us prove it to you.

LAFFITTE

WELDING PLATES

A SCIENTIFIC CHEMICAL WELDING COMPOUND. WELDS IRON AND STEEL AT A REMARKABLY LOW HEAT.

You are not taking our products seriously enough; unless your blacksmith asks for it you never give it a thought. We can easily reach the smaller man who must consider every economy, but we cannot get at the man in your shop.

The larger you are the more you need LAFFITTE.

Let us send you samples. There are endless economies you can effect, and the cost is insignificant compared with the results.

"The Squabble"

¶ The other day I read a poem called "The Silence of Life," in which I found this thought:

> "Ah me, the silences of life are mightier far,
> And higher lessons teach, than all its noisy clamor,
> So, let us know the happiness of those,
> Who keep themselves from strife."

¶ When I think of the time wasted and the dignity forgotten in business and between friends, discussing with hate and ire and anger, things that really do not matter, it impresses me with the fact that we have not migrated so very far from our chattering cousin, the monkey.

¶ Expression is life, and every man and every woman should have ideas, should adhere to certain beautiful principles of thought and action—but the most useless thing, the most conspicuous waste of time and energy, is the heated discussion over politics, religion, diet, government ownership and the rest. If a man must express a thing, let this expression be stated fairly, deliberately, clearly and as simply as possible, and then if someone says, "I do not agree with you",—remember you are challenged to mortal combat, this is a declaration of war and the one who has so expressed himself is ready to fight to the last ditch without reason, rhyme, sense or consideration.

¶ Argument between two people is never conducted with the idea of arriving at the truth, of determining the actual facts, and the man who can argue the keenest, the longest and the loudest, is the man who knows the least, who has the least regard for the opinions of other men; the man who would narrow the rest of humanity down to his point of view—the man who considers his limited, one-sided opinions as the key to the mighty riddle of the Universe with all its whirling suns and worlds.

¶ When all is said and done, only a few men are sufficiently informed on any one subject that they are content to say nothing. If a man has really dabbled in religion and philosophy and business and has gotten a view of the Map of Life from a good many angles, he begins to appreciate the philosophy of Leckey, who wrote the "History of European Morals": "over the evening of our dreams there steals the thought that we have been used by an Unseen Power for an Unknown End."

¶ The man who has learned from experience, from having lived, that strife is just exactly what Sherman said war is, has attained a happiness, a peace of mind, that prevents the petty regrets and strifes and sorrows, all down the years that are to be.

¶ As suggested a moment ago, men and women should have opinions, ideas and ideals, and man should try to live up to his ideals as far as he can—yet the Ideal is that place to which we strive, but never attain. Men and women should be familiar with the beautiful literature of the world; with the beautiful thoughts that have influenced the minds of men; of the highest principles of business; with the finest efficiency of doing things.

¶ Men and women should weave into their lives all of the golden threads there are to be gathered from the things we do—the things we think—the people we meet; from the books we read—from the business we transact. But with it all, there is certainly no place for strife, discussion, hate, worry, and the regret that comes from disputing this point and that with one of our fellowmen.

¶ None of us know a very great deal about the things we are paid to do, and certainly when it comes to deciding questions of religion, politics, philosophy and all that sort of thing, no man has the key, because every man weaves to a certain extent, his own philosophy—his own religion—is his own political boss, and no man can ever be a Personality unless he does these things for himself.

¶ I have thought about this matter of strife and discussion and argument and hate, resentment and jealousy, a great deal of late and it has gradually come to me that strife and discussion are never worth while. That it never pays to say ill of any man or woman. You must have your opinions as to the ability of certain people to do certain things, but a kind word or a tribute placed to the credit of someone else, is a thousand times prettier and a thousand times more useful than criticism. And then the beautiful part of it all is, that this attitude of mind distinguishes you and becomes you, and sets you aside from the rest of men, as fair, sincere, manly, courageous, a man with sympathy for the rest of men.

¶ So then, let us keep ourselves from strife for:

> "The silences of life are mightier far,
> And higher lessons teach than all its noisy clamor."

Sticking to One's Own Field

The moral of the astonishing Alco upset may be given in half-a-dozen words: stick to your own field! says "Printer's Ink."

Never was a clearer demonstration of the truth of the adage. The losses that have now forced the powerful American Locomotive Company out of the manufacture and sale of automobiles and motor trucks were not caused by inexperience alone, but that was undoubtedly the chief cause of withdrawal. Blinded by its own importance in the locomotive industry, it rushed rashly, without due investigation, into a field that to all practical purposes was as foreign to all its previous experience as would have been the manufacture and sale of breakfast food.

The picture is not overdrawn. Up to the very end the directors are said to have only half understood that the Alco problem was no less a selling than a manufacturing one. In the locomotive manufacturing field, practically all of the business of the country is divided between the two big companies, the American and the Baldwin works. It is not secured as a result of ordinary sales solicitation but by reason of various connections and influences maintained or exercised by the men higher up. There is, in short, no hectic competition in that industry, no sales staffs in the common understanding of the term, no tense hour-to-hour study of sales developments, no sense of time values, no appreciation, in a word, of what a selling problem actually is. For most of the time the responsible head of the automobile department was a railroad man and when the directors did get the assistance of a practical automobile man, they apparently did not know how to support him.

The $6,000,000 investment began in 1906 with the acquirement of the American rights of the French Berliet car and the importation of parts and tires from abroad. An immense factory was built at Providence, a thousand miles away from the automobile manufacturing centre of the country. This unfortunate geographical location was responsible for much of the fatal delays in delivery.

The new car was an immediate success from a mechanical point of view. It sold at $6,000, among the highest priced cars on the market.

Two or three years ago the company began to push the manufacture and promotion of heavy motor trucks. It now ranks third among American manufacturers of commercial vehicles. In the past year 85 per cent. of its business has been motor trucks. It makes more taxicabs than any other concern in the United States. An expensive service station in Long Island City and another in San Francisco are supplemented by headquarters and branch offices in New York, Chicago, Boston and Philadelphia. The factory at Providence has a real estate value of $1,000,000. It is one of the most complete plants in the country.

Enough has been said to show the scale of manufacture and the size of the distributing problem. Yet it was three or four years before the company realized the necessity of increasing the selling outlets. During that time it had just four. The first thing done by the automobile man when he took hold was to call for an aggressive advertising campaign and use it to increase the agencies, which he did, to eighty-nine.

Before that there had been practically no advertising department. While the Alco car won the Vanderbilt Cup in 1909 and 1910, the only car to do so two years running, the company had made little or no advertising use of the triumph. It apparently had not known what to do with it and so a great opportunity had been allowed to lapse.

The aggressive sales and advertising work of the past three years have been excellent but could not overcome the handicap of high costs and slow deliveries.

It will be seen that the Alco débâcle was not in any sense an "advertising failure."

The advertising appropriation, about $150,000 last year, was enough to have made a considerable dent in any ordinary situation. The advertising itself was good. The sales organization was fair. But there were enough other troubles to nullify all the virtues.

The uncertainty and, it is also reported, dissension between the locomotive and automobile departments, continued almost up to the last minute. On July 1, following the departure of L. A. Van Patten, the advertising manager—H. S. Houpt, the general sales manager, having left two or three months previously to take over the agency of the Lozier car—the advertising department was turned over to the Van Cleve Company. By August 13 the directors had changed their minds again, and last week came the announcement of withdrawal. In view of what has happened, it is not surprising. It is somewhat surprising to find that no arrangements appear to have been made to realize on the good will of the Alco name. The company proposes itself to protect Alco owners for a period of five years by standing ready to furnish necessary repairs and parts.

The Question of Uniform Steam Boiler Specifications*

By T. E. Durban**

Needless to say we are in hearty sympathy with the views expressed and the recommendations suggested by the author of this paper, and while the primary application of the subject belongs to United States Boiler Practice, there exists in Canada an equal lack of uniformity in Boiler Regulations, and an equally pressing need of reformation.

THE possibility of uniform specifications for boilers is beset with many difficulties. However, I feel that the chief difficulty has been overcome, and that united action among boiler makers will bring about the much desired uniform specifications. I think that we all have been responsible to some degree for not having a uniform specification, owing to the fact that we have been consumed with petty jealousies, each of the other. Our endeavor to get slight advantages by making changes in specifications, in order to get business, has retarded the progress of such a specification.

While we would all unite in a general way in singing the praises of the uniform specification, we did not exercise any degree of sincerity in our attempt to get to the bottom of the proposition. Now that various States and cities have taken up the matter, and prohibited the common practice of salesmen cutting specifications and making changes in order to get business, it is the belief that we will have closer co-operation among the manufacturers of boilers, to the end that we will all figure on the same thing. Now that we are united, and all see the advantages of the uniform specification, our chief trouble, we believe, is over.

Standard Specification Long Desired.

The standard specification has for many years been the desire of the company that I represent, and we have been working consistently to that end. About 10 years ago we addressed a letter to all boiler makers in the United States, trying to get some concerted action. The replies that we received were most agreable, but the action was not there. We took the matter up with our Congressmen and Senators, and finally, during the occupancy of that office by Mr. Taft, with the President of the United States, pointing out to him the necessities of a standard specification from the public's viewpoint; citing to him that the United States exercised jurisdiction over boilers on navigable waters in order that it might protect, as far as possible, the lives and property of people who used these waters as a means of transportation, and citing to him that life was not less dear to the man who lived on land and pursued his occupation on the land, than the man who traveled on the water, and pursued his occupation on the water. However, we ran across the unsurmountable barrier of State's rights, when we urged the necessity of a common law governing the building of boilers. In spite of any argument that we could bring about, we landed always in the same place. Our Congressman would have been glad to have introduced a national law, but after consultation with the President, decided with him that it was absolutely useless.

In spite of this, however, a law was passed governing locomotive boilers as used on railroads. This was cited as a reason why there should be a universal law governing all boilers, but as a matter of fact it was also pointed out that a national law was possible in this case because of the fact that these boilers were engaged in Interstate trade. There was a time when locomotives could have been and were halted at the threshold of a State and not allowed to cross the line, due to great variations of laws of construction of boilers.

Existing Conditions a Great Factor.

Now, fortunately, due to various causes, it has become manifest that boilers must be built better and nearer to a common standard than ever before. The large number of laws has made it almost imperative that a man who is engaged in the manufacture of boilers for distribution should throw his whole energy into having the law so constructed that he does not have to carry a stock of material and stock of boilers on hand to meet the requirements of the various laws in the various States, Provinces and cities.

These laws, varying as they do, now from the other, make a needless waste, and as the cry of the country now is for conservation and economy, we think that this argument can be well used with the law makers of all the States and Provinces, who will take the subject up. The waste comes from the fact that a manufacturer is now almost compelled to build each boiler to meet the requirements of each law, necessitating slow progress through the shop, and enormous investment in material. The further fact that different manufacturers put different interpretations on the laws brings about a great conflict in the price of boilers.

With a uniform law and the co-operation of all manufacturers, these differences would be largely overcome, so that the boiler would reach the consumer, not only a better boiler, but for less money. Not only would the manufacturer be able to produce the goods and sell them for less money, and be more certain of his profit, but he would eliminate the probability of a large loss in case his foreman or designing engineer should get confused in the various laws. I think there is no concern manufacturing boilers that has not suffered from the lack of uniformity in provincial or city laws, and of those engaged in making various types of boilers for distribution throughout the entire country, I venture the assertion that there is no one that has not met with very considerable loss. All this can be eliminated; the public can be protected, both as to its life and its investment and the manufacturer can make more money on less investment, if we can succeed in getting concurrent legislation, or approximately concurrent legislation, in various provinces.

Concurrent Legislation Needed.

We are fully alive to the fact that no problem that has ever faced the Canadian or American people has been more discussed than concurrent legislation. The different laws in different provinces tremendously embarrass manufacturers doing interprovincial trade, and they affect our social relations. We know the action that has been put forth to have uniform marriage and divorce laws uniform laws for crime and on credit, and on other matters too numerous to mention, but we believe no subject for concurrent legislation has been broached by people who have been so unitedly combined as to what was required as this problem that we have. There is no doubt in the writer's mind that a conscientious effort on a specification upon which we have all united will influence the law makers in a great number of States who have not yet passed a law, and in turn will influence the laws already on the statute books to such an extent that corrections will be made in them to make them conform to a standard which we can and will ultimately adopt.

It seems to me beyond doubt that a concurrent effort among the manufacturers of boilers and mechanical engineers and users of boilers cannot help but bring approximately concurrent legislation. As it is now, the laws are confusing in the extreme, and it requires the undivided attention of a bright mind to so issue the orders to the shop that the boilers will come through without trouble.

---

*From a paper read before the Boiler Manufacturers' Association Convention in Cleveland, Ohio.

**General Manager, Erie City Ironworks, Erie, Pa.

Diversity of Boiler Laws.

Boiler laws are coming out from the East, West, North and South—in every direction. Not only are the laws themselves different, but a different interpretation has been put upon the same law by different inspectors and different builders. I presume without exaggeration that there are at least 100 laws and changes to laws in the United States alone, governing the manufacture of our product, and this can be multiplied by a thousand times as many inspectors as there are laws.

Example.

We have asked a decision of one point —the butt strapping of drums. Our interpretation of the law as written in several of the States is that all butt strapped seams be made to a maximum length of 12 ft. We have been informed by some inspectors that this does not apply to water-tube boilers, and by other inspectors that it applies to all boilers. We conformed our specifications to meet the letter of the law; that is, to have no butt strapped seams over 12 ft. long, whereas we have found out since we put this order into effect in our works that many boilers or drums of boilers are being made and passed with butt strapped seams as long as 20 ft.

In spite of all this, we are thoroughly impressed that the boiler inspection laws have been and will be beneficial to all boiler manufacturers and all users, and that out of it will come the ideal boiler in design workmanship and material. This is a consummation to be desired; so that when we come to figure on a job we will be all put on the same basis, and it will be necessary for us to furnish a boiler that, in the estimation of all the law-makers, will be the best boiler made.

Boiler Laws Grouped.

The present laws as enacted have been of great benefit, as they have reduced what was formerly opinion, and frequently guess-work, to something definite and right. As we now have them, they have been classified by our engineers in three groups:

1.—The group comprising Massachusetts, Ohio, Detroit, Manila, Chicago and Indiana. Detroit, Ohio and Manila laws are practically identical. Massachusetts law differs somewhat, and the Chicago and Indiana laws are modifications.

2.—The group comprising all British specifications in which we are interested—British Columbia, Alberta, Saskatchewan and Ontario — which are all copies or modifications of the British Columbia law.

3.—The group comprising inspection laws of Philadelphia, Seattle, St. Louis, Los Angeles, Montana, New York and others. The laws of this group differ from each other, but in a general way are less complicated than those of the other groups.

Boiler Law Vagaries.

All the laws in the United States unite on a factor of safety of five. The Canadian laws require a factor of safety of five and a half to six and a half, and it is optional with the inspector what factor of safety he will accept, depending upon his opinion of the good workmanship that is done and upon just how the boiler happens to strike his fancy. The material for Massachuetts, Ohio, Detroit and Manila is special, both as to the chemical and physical properties. A certified mill test is required for all plate material, and the plates must be stamped in five different places. Other inspections require only a mill test, and are not so particular about the chemical analysis of the material.

We at one time had a boiler refused in Massachusetts, because the chemical analysis of sulphur was off one-thousandth of one per cent. We have coming through our shops, as we presume most of you have, boilers that come under almost all these laws, and the resulting confusion may be something stupendous, and must be taken care of in the price we make to the consumer on the boilers.

We have now established through the effort of the steel manufacturers, a standard specification on steel, and by common consent we have established the efficiency of certain seams, and also a certain strength that can be allowed per inch of area on braces and stay bolts, so that it does not seem a far cry to get a definite specification on a boiler itself.

Problems to be Solved.

One problem that will confront us will be the variations in tensile strength which is standard with mill. A variation of from 56,000 to 62,000 lb. in tensile strength would make a considerable difference in the thickness of a plate. If one of us should figure on 56,000 and another on 62,000, necessarily one would be figuring on a thicker or thinner plate than the other. In a common specification it would be necessary to specify the material in the braces, and the working stress in pounds. Now it varies from 6,000 to 8,000. Unquestionably, all holes should be drilled from the solid, or punched ¼ in. small and reamed to size; that is, there should be at least a full quarter inch of reaming.

In Ohio, Detroit and Manila there is a uniformity in the number of braces above the tubes; there are no particular specifications as to tubes of the material in the tubes, but in almost all the specifications the tube holes must be either cut from the solid or punched ½ in. small and reamed to size.

The butt strapped seam is now demanded on all boilers, due to the fact that it has been proved to the satisfaction of many people that lap seams are a menace to the life of the boiler, and many boiler explosions have by experts been attributed to lap seams in the longitudinal section. Some laws limit the thickness of plate to ½ in. and therefore limit the pressure on horizontal tubular boilers.

We should strive in our uniform specification for a standard specification on material, so as to remove the necessity of carrying material in stock of two different physical and chemical qualities.

If this organization, through its various connections, can establish in each legislative assembly the necessity of uniform treatment of this subject, so that when laws of this kind are coming up they can bring to bear the influence of all interested people, as they easily can, by keeping in touch with the situation of the laws to be enacted, we can accomplish our purpose. Of course, it will be attended with much hard work and honest effort, but, now that we have at least reached an agreement that a standard specification is necessary, the greatest obstacle that has prevented us from having it heretofore, has been removed.

A Uniform Steel Specification.

A uniform steel specification seems to be very easily accomplished. By comparison with three mills, we find that there appears to be no necessity for special requirements such as Massachusetts and Ohio. We find that in the law requiring special steel there is practically no difference between fire box and flange steel on these special requirements, except as to the matter of the brand. Eighty-five per cent. of flange steel coming from one mill has all the qualifications and could be stamped as fire box, and in another mill 93 per cent. of all flange steel could be stamped fire box. That is, both steels have the same chemical and physical qualities and they are changed from flange to fire box, or from fire box to flange, by a stamp which is put on, the only difference being that the mills charge $2 a ton extra for using a stamp marked "Fire Box" as against a stamp that would brand it as "Flange Steel."

"We would suggest that what is really required is more stamps on the plate showing mill test, and less stamps showing the brand. If the mill test stamps are put on so that they can be observed by the inspector, he can then get the full record of the plate from this heat and mill test stamp. He can also tell what the tensile strength is, and not assume it. As a matter of fact, all inspectors and all State laws will assume the minimum tensile strength the law permits, unless they have access to the physical test as made by the mill. There ought to be uniformity regarding this point.

Flange and Firebox Steel.

In these specifications, particularly of Massachusetts and Ohio, fire box steel is specified in the shell and flange steel in the heads. This, in our estimation, is an error. If there is a difference in the steel, and if the fire box steel is supposed to be of a better quality, attributable to its increased ductility, which would make it a better steel for flanging, the law is exactly contrary to the best practice in steel. The best steel should be used for flanging, and therefore the specifications and the law should read, according to our ideas, flange steel in the shell and fire box steel in the heads. As before stated, however, there is no difference in the quality of the steel, hence, we feel that the Massachusetts, Ohio and Detroit inspection laws calling for fire box steel in the shells is clearly in error, militating against people who buy boilers under those laws.

We doubt very much whether any State law would hold good, if it were tested, that specified a certain brand on the plate. We believe that any court would decide that if the plate came up to the physical and chemical test required by the law, it would make no difference what the plate was branded, and it might not be a bad idea for this organization to designate some manufacturer to ship a boiler into one of these States and have it branded "Flange Steel" and make a test case; of course, with the hypothesis that the flange steel passed the physical and chemical tests to entitle it to a brand of "Fire Box."

The boilers that the company I represent manufacture and whose specifications have been submitted, would pass any of the American laws except such laws as call for fire box steel. To a concern building an occasional boiler, and that does not have to carry material and finished boilers in stock, the difference in price of $2 a ton would not be material, but it is important with one that carries a large amount of stock and a large number of finished boilers, and uses from 10,000 to 12,000 tons of steel a year. It can be readily appreciated that it would cost from $20,000 to $24,000 a year to use flange and fire box steel, and it would necessitate carrying, in order to supply the trade promptly, double the amount of stock, both in the flange plate and in the finished boiler; all of which would have to be made up in the price charged to the consumer for the boiler.

Using Flange Steel Throughout.

Along the line of conservation and economy, would it not be wise to adopt flange steel for boilers throughout, for, as previously stated in this paper, there is no difference between flange and fire box steel from the majority of mills except the stamp? It is a direct discrimination against purchasers in various States where they have the law of fire box steel, causing them to pay more money for their boilers. In other words, is it not a fact that the people who reside in States that have not yet passed these laws will get a better boiler, or as good a boiler at least, for the same money, as a resident of a State who buys under the law providing for special steel? The man in the adjoining State would get steel of the same physical requirements and the same chemical analysis and he would get it for less money.

Again, some States require brackets on the boiler, while some States require the boiler to be suspended from a gallows frame. Will a gallows frame support a boiler any better in Indiana than it would in Massachusetts or will a boiler with brackets on stand any better in Massachusetts than it will stand in Indiana? All these things cause extra expense to the manufacturer, and make an extra price to the consumer, for which he gets no adequate return.

Recommendations.

In conclusion, we would recommend:

That boilers be built on a factor of safety of five, of uniform steel, and that this specification cover flange steel.

That the steel be marked with the heat number instead of the brand, and that it be made of minimum tensile strength of 60,000 lb., and be subject to the bending and quenching test, and that it have phosphorus not to exceed 0.03 per cent., sulphur not to exceed 0.04, and manganese 0.50.

That weldless crowfoot type braces be used, of the same quality of steel as the plate, that they be figured on a basis of 7,500 lb. per sq. in. of section in the brace, and that on this basis, no brace be used containing more than 1.28 in. area of section.

That through braces, either above or below the tubes be weldless, and be figured on 7,500 lb. per sq. in. of area.

That all seams be butt strapped with inside and outside covering strips.

That all manholes be 11 x 15 in.

That no plates be used in a tubular boiler thicker than ⅝ in.

That all holes for rivets be punched ¼ in. small, and reamed to size.

That all flue holes be punched ½ in. small and reamed to size.

That no cast iron be used in connection with the boiler, either for reinforcement or any other purpose.

That all plates be beveled on a planer instead of sheared on a bevel shear. A demonstration on a 9-16 in. plate shows that it is impossible to do a good job on a splitting shear, and that the same objection that exists to a punched hole holds good in the use of a splitting shear on thick plate; that is, the metal is distorted by use of a splitting shear.

That water column connections all be 1¼ in.

I would recommend, also, that a committee be appointed with power to bring together a committee of boiler makers, steel manufacturers, State and city officials, whether they be inspectors or chairman of the boards; a committee from the American Society of Mechanical Engineers, and a representative from the leading boiler insurance inspection companies; and that the meetings of this committee so appointed shall be open to the general public and that this be done within the next 60 days, in order that rules and regulations may be adopted that can be made uniform for the construction of tubular boilers.

I would also recommend that the utmost publicity be given in all the trade and mechanical papers to the efforts of manufacturers to procure a standard specification.

CONCERNING CREOSOTE.

By W. L. C.

THE last few years have seen a rapid development of the wood preserving industry on the North American continent, largely owing to the increasing scarcity and cost of good tie timber. At the present time there are two standard preservatives in use, zinc chloride and creosote. As zinc chloride is a mineral salt, it is possible to manufacture it to meet specifications. Creosote, however, is a by-product of a by-product, and hence it is very difficult to obtain a desired specified quality. As a result, it has been found necessary to base the specifications on the kind of oil available.

As creosote is used to preserve about 70 per cent. of the lumber treated, and as it appears probable that a shortage will occur in the near future and that high prices will prevail, the problem of increasing the supply is an important one. Creosote is produced in by-product coke ovens, and the threatened shortage should further their increasing adoption as there is enough creosote wasted every year in the beehive coke ovens in Canada and the United States to supply all reasonable demands for years to come.

High Speed Steels and Modern Shop Methods

By J. D. Smith.

The writer of this article points out several features which should be given consideration in the purchase and use of high speed steel in machine shop practice, and draws attention to the fact, too often overlooked, that the old water hardened steels may be successfully employed in many instances and with increased economy comparatively.

ENGINEERS of to-day have come to see the blessings or otherwise of the high-speed steels. Some managers and some workmen, make the mistake of trying to get too much out of the new steels, while others—and these show the best balance sheet at the year's end—are content with fair results.

Machine Effects.

There are many things to be considered when changing from the old water-hardened steels to the new. First, the machine tools. Where these are of the old type, they must be brought up to the new requirements or the best results cannot be obtained; as they were designed for far less stresses. It was impossible to strain or at least break the machines when using the water-hardened steels, as the tools would invariably give out first; but in my experiments with the new steels, I have frequently strained and sometimes broken machines, lathes especially, without damaging the cutting edge of the tool. Then comes the question of re-designing those parts which have given out under the tests. If lightly made, alterations will not get the results, and it is better to scrap the machines.

Best Results Feature.

Now comes the main question, What are the best results? This means two things, output only, or output with economy. Some men's ideå of the use of high-speed steels is to run the tool to destruction at the highest speed the machine will stand, then change the tool for a new one. This may be all right from the point of view of output, but what about the waste of steel with continual re-grinding, grinder's time, wear of machinry, machine-man's time for walking backwards and forwards to the tool stores, machine standing idle? The iutput largely rests with the conditions under which men have to work. Under fair conditions, the output increases, if the conditions are unfair, it drops accordingly.

Sometimes it is decided to get only the best steel on the market. This, in my opinion, is wrong policy, although I am strongly against having too many brands in the shop. After a general survey of the machines, a selection of three or four at the most can be made to cover all the requirements of the shop. Turning locomotive tyres, mill rolls, etc., requires the best possible steel to machine them at the speeds which the machines of to-day are able to stand. Various makers of tool steels make special brands for this particular work, but at a special price, which is the top price. It would not be economical to use this steel to machine ordinary forgings from 20 to 26 tons tensile or Yorkshire iron, neither would it help the output, as steel can be found at much less cost that will machine these softer metals at the highest speeds.

Up to this point we have only considered the ordinary tool which is either ground from the bar or forged to shape at the end, but there are milling cutters, forming tools, etc., which take a far greater expense in their manufacture. Milling cutters, either plain or formed. should always be made of a good brand of high-speed steel, as even if the machine is not capable of a speed or feed approaching the cutting limits of the cutter, the advantage will be gained in the grinding, especially on the machines using gangs of cutters. The only exception is when a very small quantity of articles has to be machined, and the outlay would not be justified. The forming tool for lathe, turret, capstan lathe or automatic machine, comes under the same conditions.

Water-Hardened Steel Not Obsolete.

The water-hardened steel must not be regarded as obsolete, as there are many ways in which it can be used. It is still the best steel for brassfinishers' use, when machining ordinary castings or naval brass bars, as it only requires slacking off by the tool smith after being ground, or in special cases filed to shape. With the highest priced high-speed steel, the output could be no greater, as the ordinary water-hardening steel is capable at the highest speeds possible when machining these metals. It is economical to use high-speed steel when machining the harder mixtures, such as bronze, etc.

Where spring radius or filleting tools are used, it is unnecessary to make these of high-speed steel, as the finishing speeds are so slow that the water-hardened steels are able to stand. The tendency, however, is to do all the finishing in a grinding machine if possible, this method giving greater accuracy for both parallelism and roundness than any lathe, and the time taken being considerably less.

There are many examples on the slotting, shaping and planing machines where it is better to use water-hardened steel, nothwithstanding the using of releving cutting bars, tool holders, etc., as when machining a surface broken by cored holes, or two or more pieces being piled on top of each other, and there being spaces between. The high-speed steel is more subject to snipping at the cutting edge when jumping over the spaces, although this can be obviated to a certain extent by slacking the tool off in oil, instead of the usual method of cooling in an air blast.

The Lubrication Feature.

Another point which has caused endless controversy is lubrication when using high-speed steels. It is impossible to get the lubricant between the cutting edge and the material, so the next thing tried is flooding the whole tool nose or cutter with lubricant, also the job, making the machine messy, and making it harder for the operator to caliper while the job is running. The lubricant is supplied by a pump, not altogether infallible, and which, therefore invariably breaks down at the most awkward moment. I have experienced all these annoying instances, and have come to the conclusion that it is far better to use the high-speed steels cutting dry, wherever possible to do so. The best results are obtained from lubrication in the cases of drilling and milling machines, as these operations are usually finished surfaces, the lubricant giving a far smoother finish than dry cutting.

There are many makes of high-speed twist drills, round with grooves milled out of the solid, and flat vanadium twisted drills, etc., at varying prices. It is no use to pay the high price for a drill guaranteed to drill at 6 in. or more per minute in depth when the arm of the radial drilling machine is not capable of standing the strain; either pay a less price for drills, and get those which are just above the limits of the machines, or get new machines capable of standing the higher speeds and feeds of the high-priced drills. High-speed steel, like all other inventions, must be used judiciously and within reason. — Machine Tool Engineer.

EXHAUST VENTILATION.

A SHEFFIELD factory inspector reports that, though exhaust ventilation has been provided throughout the grinding trades, he is not satisfied that it is perfect in all cases. The cyclones are already wearing out by the constant whirling of the dust round the inside, and the corrosion on the outside by the weather. As a substitute for these, brick chambers have been built, connected by a pipe to the chimney stack. They appear to be satisfactory, and to prevent the dust from escaping into the atmosphere.

He regrets that the workmen themselves do not carry out their share of the duties to the full extent, and finds exhaust ducts stopped up owing to improper things being allowed to enter; hoods not properly adjusted; glass in the hoods broken; and sometimes grinding being done with the valve between the hood and the duct closed.

Again, in those places where respirators have to be used, men are frequently found racing stones without them, and others working in the room at the same time. The weekly cleaning does not appear to be done as regularly as it should be done, though special visits of inspection are paid for the purpose of enforcing it.

DONT'S FOR CRANEMEN.

S. F. MATHENY, crane foreman, contributes the following "Dont's for Cranemen" in a recent issue of the Inland Steel Co. "Safety Bulletin":—

Don't fail to ring your bell when moving the crane or hoisting a load.

Don't hoist loads not in line with the trolley.

Don't lower material into a car until you are certain there is no one in the car in a position to be injured.

Don't move any load without a signal from the proper man. Recognize the signal from one man only.

Don't hold loads with magnets above persons on the ground or above points where persons may walk.

Don't go on the crane runway or cross from one crane to another by walking on the crane runway.

Don't use your crane to move cars.

Don't allow men to ride on a load carried by the crane or on crane hooks or trolley. Refuse to move.

Don't drag slings, chains or cables. Carry them high enough to clear men and machinery on the floor.

Don't fail to have the burden block as low as possible when working on the hoist or removing the armature.

Don't go, or permit any one else to go, on top of the crane without opening the safety switch on top of the crane, and placing a "Danger—Do Not Move" sign on the switch.

Don't close a switch until you are sure it is safe to do so. Examine the trolley carefully.

Don't fail to test the hoist brake when handling heavy loads, particularly hot metal, by throwing the controller "off" position after the load has been lifted a few inches; if the brake does not hold the load, do not move the crane until it has been repaired or adjusted.

ENAMEL FOR SHEET STEEL.

SOME interesting information on the enameling of sheet steel was recently contributed by Robert D. Landrum, to the Journal of Industrial and Engineering Chemistry. After dealing with the great amount of secretiveness which has surrounded this industry, not alone regarding the materials entering into the enameling compound, but also as regards the weights of the constituent parts, he outlines something of the preparation of the material. This part of the article is as follows:—

Preparation of the Material.

The raw materials in due proportions are emptied on a maple floor, and thoroughly mixed by shoveling. Elevators then take the materials up to bins, from which they are discharged in melts of about 1,200 lb. into tank furnaces of the regenerative reverberatory type, which are best heated with gas (natural gas or producer gas) up to 1,000 deg. (for glazes), or to 1,300 deg. C. (for ground coats).

The hot melt is discharged into cold water; a violent reaction ensues, and the flux is broken up into small particles full of cracks. This quenching is to toughen the "enamel frit" and to facilitate the grinding, which takes place in large ball mills, with cylinders up to 6ft. in diameter, lined with porcelain. By 30 hours' grinding, the mixture of enamel, together with flints, clay, tin oxide, and half of its mass of water, is turned into a creamy fluid, which is allowed to age in tanks for a week or so. It then passes to the dipping-room into shallow troughs sunk into the tables, which are provided with slushers. The slusher takes the stamped sheets or utensils and coats them with the cream; the article is afterward placed bottom downward on three steel points to dry. When thoroughly dry, the articles are passed into muffle furnaces, where the enamel fuses or coalesces at about 1,000 deg. C.

Thus the first coat is prepared, which is frequently black, because oxides of nickel and cobalt are added to increase the adhesion to the steel. To apply a second and a third coating the article is returned to the dipping-room. The dried but not yet baked articles must be handled very carefully, lest some of the dry powder come off. Creams for mottled enamels are applied by means of atomizers. Waste materials from the floors and from the water-settling tanks are carefully collected and utilised in making cheap goods.

Steel Constituent.

The steel on which the enamel is to be coated should, as nearly as possible, be free from carbon, silicon, sulphur, and phosphorus, and should not contain more than 0.2 per cent. of manganese. When the articles are stamped, a lubricant is used which can be easily wiped off, and heating is avoided; ears, handles etc., are welded on rather than riveted, because riveted portions do not take the enamel well. The article is afterward well annealed at low-red heat, pickled in hot sulphuric acid, rinsed in water and weak alkali, and quickly dried. It is then ready for enameling.—Iron Age.

◆

BOILER BAGGING.

THE majority of the reported cases of boiler bagging are due to the presence of scale or oil in the boiler, states a writer in the "Power User." The removal of the former may be accomplished by what has been termed the "periodically clean" method—that is to say, by the use of mechanical cleaning methods each time the boiler is opened up for inspection, by the introduction of boiler compounds, or by treating the feed water chemically.

No amount of chemical treatment will remove oil from feed water, however, and some mechanical filtering process must be relied upon for its elimination. Some engineers favour cloth filters and some sawdust, sand or other substances; but most depends upon the design of the filter itself, and individual manufacturers of these apparatus may be relied upon to adopt the filtering medium which is best suited to their own construction.

With regard to the comparative harmful properties of various oils, the most dangerous bags and blisters are generally caused by animal and vegetable compounds, with or without the additional presence of scale. Attempts to boil them out with soda or some alkali are to be severely condemned as rendering the oils more dangerous still. As has been stated, no amount of boiler compound can counteract the ill effects of oil entrained in feed water, it being imperative that some external mechanical means be adopted when it is present.

Free Pig Iron Proposal.—The chief difference of opinion between the U. S. House of Representatives and the Senate over the Tariff Bill is due to the proposal to put pig iron and other coarse grades of iron and ferro-manganese on the free list. The Senators think this would result in too great a sacrifice of revenue.

Observations Concerning Current Gas Engine Practice*

By W. Fennell, M.I.E.E.

The author of this paper discusses in a clear and convincing manner the position of the gas engine as we find it to-day, and at the same time gives prominence to much valuable data, whereby those engaged in or about to engage in the manufacture of this power unit, large and small, may have imparted to them a clearer conception of successful product requirement.

I SHALL confine my remarks to engines of from 12 in. to 36 in. diameter pistons, or, in other words, to medium powers, such as would be met with in stations up to 3,000 kilowatt capacity. In the first place, I would divide the types into two and four cycle, and it must, I think, be admitted that at present the two-cycle engine is in the experimental stage. The two-cycle engine should be cheap, but it is not at present very much cheaper than the four-cycle. I think this is because no maker has succeeded in producing a commercial two-cycle engine without gas and air pumps. Motor car and other small engines have been so made, using the crankcase as the displacing cylinder, but one does not like to contemplate a back fire in a 500 h.p. crankcase.

Two-Cycle Engine Features.

The first advantage claimed for a two-cycle engine is the absence of exhaust valves. The piston on its outward path uncovers the exhaust ports, but much of the apparent advantage disappears when one has had experience with large exhaust valves. I think the question of exhaust valve leakages is unduly important in our minds. Every man who owns a motor car has valve leakages as a nightmare. In large engines, the valves do not need much grinding in, as a slight leak is not serious. The volume of charge is so great that only a small percentage can escape even if the valve "fits where it touches." I should not, therefore, give much heed to absence of exhaust or of inlet valves and the troubles with them, unless convinced that there would be less trouble with gas and air pumps and their valves. I should also ask for proof that the two-cycle engine is cheaper to run than the four-cycle, taking interest and depreciation, fuel cost, lubrication and repairs.

Another point to consider is heating—there are, other things being the same, twice as many explosions as with four-cycle. This means that for a given cylinder area and piston speed we have to get rid of twice as much heat. Are we able to do it without overheating or without excessive casting strains? What value the exhaust and suction strokes on a four-cycle engine have in preserving lubrication, and in reducing skin temperatures of cylinders and piston rings can only be surmised until we have more experience of large two-cycle engines running without these two "idle strokes."'

With regard to mechanical efficiency this should be to the credit of the two-cycle if the inefficiency of the pumps does not destroy it. The effect on economy is, therefore, rather involved—we know that the power output is increased for the same cylinder volume, and we must set the undoubted economy against the loss due to part of the charge getting away at a time of exhaust and admission. The following are representative "best" figures for engines of 400 B.H.P.:—

4-cycle, 9,000 B.T.U.'s = 67 ft. of 135 B.T.U. producer gas per B.H.P. hour.

2-cycle, 10,500 B.T.U.'s=78 ft. of 135 B.T.U. producer gas per B.H.P. hour.

I look to the future of the two-cycle engine as being bright, but it will have a hard fight against the established position of the four-cycle engine.

Vertical v. Horizontal.

It is unfortunate that vertical engine makers will insist on running at high speeds—not high piston speeds, but high revolution. In all well-known types, we have to consider high speed vertical versus slow speed horizontal. This confuses the question, and is apt to mislead one. It is the old battle of the steam engine types over again, and the result may be the same. Just as the steam turbine came in and disposed of the question of steam engine types in large sizes, the gas turbine will possibly settle the question of vertical and horizontal gas engines.

The first engines were horizontal, and because there was trouble due to cylinder wear, some thought it was the weight of the piston which had something to do with it. A very elementary calculation shows, however, that the forces due to angularity of the connecting rod so greatly exceed the weight of the piston that the latter can be ignored. Vertical engines, being restricted in height by practical considerations, usually have shorter connecting rods than horizontal, so that the side thrust is greater. It is clear that gravity takes so little part in the question that whether you run an engine on its side or on its end or upside down, it makes little difference to piston and cylinder wear.

There is another and much more important cause of wear on the cylinder walls than weight, and perhaps even the thrust. If one imagines the piston a little smaller than the cylinder, and again, if one imagines that the piston rings do not fit very well, we get a space on the side opposite to the thrust, and in this space we get pressure approaching that of the explosion. A very slight consideration of the matter shows that we may get a very large force assisting the thrust. I have more than a suspicion that the idea of splash lubrication was the real inducement to the modern designer of vertical engines, both steam and gas, but splash lubrication is dead.

Vertical Engine Advantages.

There are one or two points in favor of the vertical engine, and these are questions of:—

(1)—Expansion.—The cylinder can be supported on one end, and so may grow vertically without restriction.

(2)—Lubrication.—The oil leaking from the little end and splashing from the big end will tend to run away from the cylinder and so restrict, and perhaps prevent, over-lubrication. The difficulty to-day is not to get enough oil, but to restrict it.

(3)—Small ground space occupied.

Vertical Engine Disadvantages.

The disadvantages of vertical engines are the necessity for restricting the dimensions of the crank chamber, due to considerations of strength, and consequently absence of room to get at the working parts; the fact that burnt oil and tar is constantly collecting on the piston head and is forced down between the piston and cylinder and behind the rings, and the temptation to high rotation speeds and short stroke, owing to the need for restricting height.

Vibration also is a more serious question where the forces are vertical—it is almost impossible to prevent transmission of vertical vibration from the bed to the ground. In a horizontal engine, one could put the underbed on rollers, but one could hardly support a vertical engine on springs. I know that cork and rubber cushions have been used, but they are not, in my opinion, a practical solution of the problem of transmitted vibrations for large engines. The cost is very great, and deterioration must be fairly rapid.

---

*From a paper read before the Birmingham District Electric Club on March 8th, 1913.

Having indicated the fallacy of saying much on this question, I would like to say that, to my mind, the reciprocating gas engine is made vertical or horizontal just as fancy leads the maker, and it should be bought entirely on the question of cost of or availability of land. If one has cheap land available, it is of no real consequence.

Balancing of Engines.

In many cases we must avoid transmitted vibration, and the question of balancing of engines comes very forcibly before one. There are two or three propositions which should be laid down although I don't intend to prove them here.

(1) Unbalanced reciprocating masses can only be half balanced by weights on crankshaft.

(2) It is not enough to consider balance in two planes, but one must take three dimensions. That is, it is not enough to take two cranks at 180 deg. and say we get balance, because the pistons move in opposite directions.

(3) The out-of-balance forces increase in proportion to the speed squared.

(4) The forces of explosion have little or no effect on the question when one is considering vibrations external to the engine.

These elementary principles are not realized as fully as they might be. The out of balance forces are large in gas engines because pistons and connecting rods have to be heavy, and the piston speed must be high. From the above it follows that a single crank engine cannot be in balance. The best one can do is to resolve the unbalanced reciprocating forces into two, each half the amount, the one horizontal and the other vertical.

A two-crank engine, although nearly balanced vertically and horizontally has a rocking out of balance around a plane at right angles to the line of crankshaft, and parallel to and between the two cylinders. The nearer together the cranks can be got, the better the balance will be. The type in which there is a centre flywheel or a generator, and there are two lines of pistons, one on each side, is about as bad as can be from the point of view of balance. A two-crank engine with cylinders in line and pistons going in opposite directions is very good as far as balance is concerned, but is weak mechanically.

A four-crank engine can be nearly balanced if the two centre cranks are at 180 deg. with the two outside ones. A three-crank engine can also be nearly balanced in all planes. These few notes may serve as a guide in deciding types of engine for difficult situations.

Turning Moment.

Evenness of turning moment may be obtained by either multiplicity of cylinders or by heavy flywheels. This being the case, it is a question not for the purchaser, but for the engine maker. For electrical work, a cyclic variation of 1-150 is the worst that should be tolerated, and for A.C. work, 1-300 is the maximum which can be allowed.

Purchasers should forbid the use of two flywheels, one on each end of shaft. These tend to cause racking strains and shaft breakages. The flywheel should be the driving pulley itself, or close up to it. Breakages of crankshafts have practically ceased since the use of two flywheels have been abandoned.

Cylinder Construction.

This is one of the most difficult questions which the engine designer has to face. The difficulty is that the inside wall must be hot while the outer portions are cold. Then again, the compression space is hotter than the other portions of the cylinder. The exhaust outlet is subject to a higher temperature than the inlet. One also has to deal with cast iron, itself a metal particularly liable to initial casting strains, and very brittle anyway. The wonder is not that cylinder and jackets crack, but that they stand as well as they do.

Each maker has his own ideas of cylinder construction and support, but there are few who have really solved the question. The following points are important:—All inlets to compression space passing through the water jacket should be fixed to the cylinder only and be packed where they pass through the outer jacket. In multi-cylinder engines, the exhaust branch pipes should be long, and enter separately into the exhaust mines—or if this is not possible, then the exhaust manifold should be provided with expansion joints between each cylinder.

Cylinder liners are not often used in high-speed engines, and they are of doubtful use in low-speed engines. There is a difficulty in securing contact between a liner and the main casting, and there is a distinct risk of deformation. Practice is now fairly established in the direction of reducing cylinder wear, not in providing for renewal of wearing surfaces. In one make of engine (the "Premier") there is a liner of a most ingenious construction, in which the liner is the cylinder itself, and is separate from the outer casing of the water jacket, to which it is bolted at the combustion end. The liner passes through a gland at the outer end of the jacket, and the combustion chamber is bolted to the liner. This is the most perfect cylinder construction I have seen for a single-acting engine.

Cylinder Support.—The usual practice is to fix the cylinder at the outer end only, leaving it free to expand towards the combustion space end. With large horizontal cylinders the back end of the cylinder must be supported, but not fixed, so that it is free to expand and contract, but not to droop.

The exact shape and design of pistons is also a very delicate matter, especially in simple pistons not water-cooled. In the piston construction will be found the key to the success or failure of engines, say, 12 in. to 3 ft. bore. Some makers attempt to use uncooled pistons of 18 in. diameter, but this is, I think, a great mistake. My experience is decidedly against large uncooled pistons, and I should say that 12 inches in four-cycle gas engines and 9 inches in others is the limit for non-cooled pistons. If one considers what goes on in a gas engine cylinder, the reason for this statement becomes clear.

On the compression stroke there is a leakage of mixture past the piston, carrying with it oil and tar and grit, which work behind the piston rings. All along the compression stroke, the piston is overtaking the cylinder walls, i.e., collecting dirt from them. At the end of that stroke, the temperature has risen, and then with ignition there is still greater rise of temperature, and on the explosion stroke the oil on the walls is probably burnt, and then on the exhaust stroke is again swept up by the piston. The result is that with a hot piston head, hotter than the distilling point of the tar and oil, there is a constant transfer of thick oily matter to the clearance behind piston rings.

If the temperature gets above a certain point at the first ring, the thick oil and tar coke and become "carbon." This carbon forces out the piston ring and sets it hard, causing excessive friction and final seizing of the piston. It is here that one feels the disadvantage of multiple cylinders. Where the engine drives a dynamo in parallel with others, or a battery, the reduced speed causes the dynamo to drop the whole of its load, so that the whole power is available to do damage. In a single-cylinder engine the seizure stops the engine, and the mischief is usually confined to a second cylinder wall, but in a multiple, say 4 or 6 cylinder engine, there are five other cylinders working, forcing the sixth piston over its cylinder surface, with the result that the cylinder wall is torn to such an extent that the cracks go right through, and if one is not very lucky, the connecting rod of the seized piston will buckle, or some other part will give way, wrecking the engine.

So many Diesel engines have been entirely wrecked from this cause, that the insurance companies are refusing to insure them. Certain types of high-speed gas engines are also liable to the same defect, and I am strongly of opinion that no large engine design can survive unless it has water-cooled pistons. It is strange that so great a trouble arises from such a small cause, viz., a piston head hotter than the burning point of oil and tar.

Valves.

As before indicated, I do not feel at all nervous over valves. They are now made non-water-cooled in all sizes. Cast iron faces with steel spindles and heads are standard practice for exhaust, while steel valves are usual for inlets. With heavy heads and long spindles well shielded from exhaust gases, there is no real trouble, i.e., the defect is hardly discovered until overhauling, when it is found that the face of the valve has a hole in it. Flat-faced valves are often used for exhaust and mitre faces for inlet valves, but the mitre seat gives the best shape of outlet, reducing throttling of the gases passing through. It is important that the cams be arranged to drop the valves lightly in the seat, and in many slow speed engines we have the rolling lever and eccentric gear for this purpose.

Lubrication.

The lubrication of a gas engine requires special care and much forethought. The cylinder lubrication in particular is a very awkward matter. It must be admitted that there is no oil which will stand the temperature of burning gases, and there can hardly ever be one. One might hope for an oil which would burn away, leaving no deposit, and until this appears we shall continue to have serious trouble with gas engine lubrication.

There is no doubt that any attempt to utilize splash lubrication for cylinders is a failure; one cannot control it, and too much oil is as bad as too little. Every vertical engine I know but one (and that a very expensive one) has a trunk piston, and, as a consequence, the oil from the big and little end splashes on to the cylinder walls, causing over-lubrication. Baffles are usually put to reduce the amount of oil reaching the walls, but this is after all a crude method of control.

I am strongly of opinion that the successful engine of the present and of the future must have a crosshead, whether single or double-acting, horizontal or vertical. The crosshead must be a reasonable distance from the piston, so that oil will not splash on the cylinder walls, and one may then control the lubrication of the cylinder to a nicety. The crosshead also facilitates piston cooling, as there is more room for gear to get the water to and from the piston. There is no doubt that the lubrication of a horizontal piston is easier than that of a vertical type; in the horizontal piston if one delivers oil on the top there is little fear of the oil missing the bottom; it is bound to work down. In vertical engines, the oil should be fed to at least three or four points around the cylinder, and it must, of course, be forced in.

With reference to lubrication of engine bearings, the practice of Browett, Lindley and Bellis cannot be improved upon very much, but I should like to see the pumps external to the engine, and there should be oil coolers for large enclosed engines. The level of oil in the crankcase should be well below the cranks and balance weights, but lack of room often results in this being sacrificed. If, however, there is an oil tank external to the crankcase from which the pump sucks, and to which the oil returns, there need be no oil retained in the crankcase, and there is no fear then of large quantities of oil being picked up or blown up into the cylinders. The average vertical engine crankcase gets into a filthy condition, as it cannot be cleaned out easily, owing to the strengthening webs.

Governing.

There is no doubt that the best combination is quality governing from full to two-thirds load, with throttle governing below that, or what comes to the same thing, govern on the gas down to two-thirds load, and on air and gas after that. By this means, one runs on a good mixture at all times, retaining the thermal advantages of full compression at all but the lower loads, while at the lower loads there is a good mixture, no risk of misfiring, and consequent irregularity of running. One must, therefore, choose the system of governing to suit the conditions. It is, however, unnecessary to complicate the governing system, if one is not going to run much at under two-thirds load.

Ignition.

There is one very interesting point with regard to earth returns on ignition systems. It is absolutely necessary to provide a substantial return from the lay shaft to the frame. It is almost unbelievable that the lubrication of the bearings, etc., is, in the best engines, so perfect that there is no metallic contact between the moving and fixed parts of an engine. I have been compelled to fix substantial earthing brushes in several cases after an engine has been running a few weeks. These brushes get neglected, and for this reason should be in duplicate, and should be quite as mechanical as the main contact brushes.

Starting.

Large engines to-day are always started with compressed air, usually for producer gas engines, at about 250 to 300 lbs. per square inch. In large cylinders, care is taken that no gas enters that cylinder until the air is shut off, but in smaller ones, the risk of a heavy pressure due to firing at 300 lbs. compression is taken. The chief point to safeguard in this matter is to have plenty of air storage, and, if possible, two compressors, to allow of three or four attempts in the event of the ignition being out of adjustment. Arrangements to use the compression of the engine to fill the tanks on shutting down are dangerous; gas may accidentally be mixed with the air.

Water Circulation.

A very few remarks on this subject will suffice. Circulating tanks are out of the question for large engines, so it becomes necessary to adopt some more compact form of cooler. There are several types of rotary coolers, in which a fan forces air over rotating surfaces dipping into the water. Again, one can employ cooling towers, which are very efficient, and the loss of water is little. Rivers, canals, or cooling ponds can rarely be used to-day, and tanks on the roof are very expensive. Speaking generally, one must force the circulation, and to do this a pump is required. This pump should not be driven from the engine; it is an absurdity to be compelled to shut down a large engine because a belt slips or breaks. There should always be a reserve from the water company, if sufficient can be obtained to supply the engine, or there should be a reserve pump.

I lay great stress on this question of water supply, because it is the weak point of most gas engine installations. There is no need to-day to put in ram pumps. For heads up to 30 ft., the new types of centrifugal and turbine pumps are more efficient, less likely to go wrong, and less expensive. There should be thermometers on the water outlets from various parts of the engine, and pressure gauges on inlet and outlet.

◆

Metal Furniture.—The use of metal furniture in the offices of American street railways and other public companies appears to be gaining favor. Furniture of this kind is not much more expensive than wooden furniture of good quality, but it is more substantial, fireproof, and serves materially to reduce the rate of insurance. It is especially adapted for the storage of unimportant records.

GRINDING WORK ON AN ENGINE LATHE.

By H. Womersley.

MUCH has been written on the subject of grinding, and opinions differ somewhat as to the success of a grinding system. My opinion is that, if properly supervised, grinding is a means whereby production can be increased in quality and quantity, and the arrangement here illustrated will help the small business man to more successfully compete with the larger concerns.

On certain work we had to do the firm got instructions that it must be hard and ground to a limit. The quantity did not, however, warrant the purchase of a grinding machine. The manager and I, therefore, drew up a sketch, and decided to rig up an engine lathe to do the work. It turned out to be a great success, for eventually orders came in so fast that the firm found it necessary to buy a grinding machine, but at the present time the attachment is being used to help the grinder to cope with the work. I might say that this particular firm is a leader in producing a certain class of machine and is known all over the world.

I afterwards introduced the scheme to a tramway manager, and he used it very successfully to grind armature commutators. I had another engineering friend, and he was a works manager. I used to visit his works very regularly, and noticed he got work which needed grinding. I suggested to him this rig up, but he declined the advice. A few weeks later six hardened collars came to his works to have .015 in. taken out of the bore. He first tried lapping out the holes, but found it unsatisfactory. His second method was as disastrous as the first. He got the collars annealed, then bored a little out of the hole, rehardened, and finally polished up with emery. As a result, the workman was disappointed, likewise the manager, and the man who gave the order doubly so, because he had to pay an excess price and nearly got his job scrapped. Needless to say, no more orders came from that source.

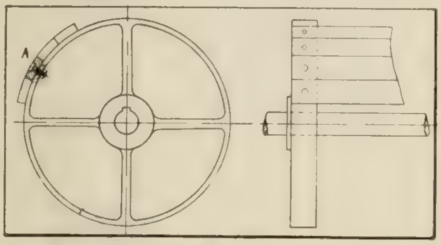

FIG. 6—GRINDING ON AN ENGINE LATHE.

My advice is, if you have not a grinding arrangement, rig one up at once. Do your own ordinary work on it, then when special orders come along you will not be found wanting, but will prove that you are moving with the times, and able to produce a well finished article. I could give a number of instances to prove this is a practical idea and not theoretical, but enough has been said from that point of view. Study what I say, weigh it up in your own mind, and ask yourself will it apply to my work? Try it, as it is not an expensive venture, and let the result be your guide for future action. It is quite possible it will be the foundation for a successful period of trade, because to be successful we must move with the times.

The Lathe Feature.

In choosing the engine lathe to do the grinding, choose one of rigid construction. See that it is fixed to a solid floor, because rigidity is essential for efficient grinding. Having chosen this lathe, get a casting made, as shown in Fig. 2. When machining this casting, make the bearing nearest the grinding wheel ⅛ in. larger than the other as shown. Drill holes at other end of casting to suit compound rest. Make bushes and fit as shown. The grub screw (A) keeps bush in position, and (B) shows bush with saw gauge through it. A distance piece (C) takes up wear in bearing, and Fig. 4 shows pulley for spindle. Fig. 5 shows wheel spindle, which, if for

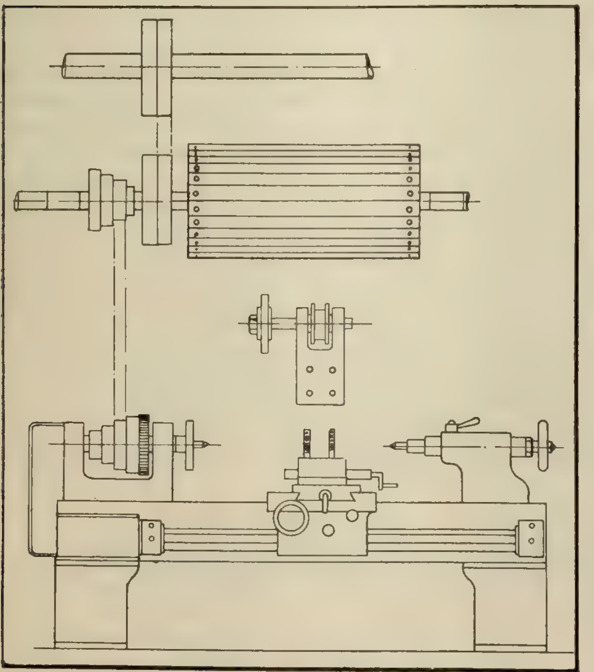

FIG. 1—GRINDING ON AN ENGINE LATHE.

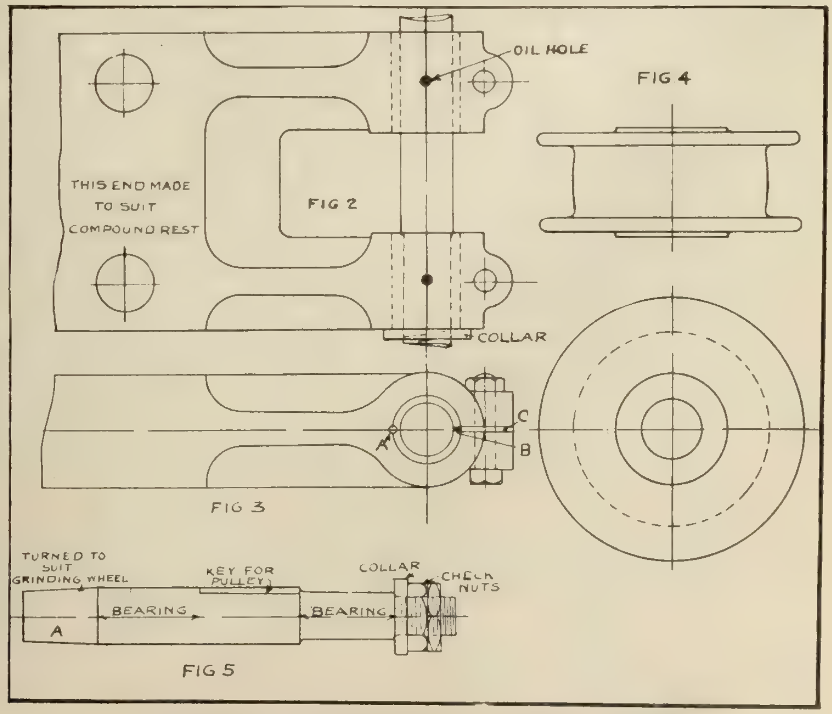

FIGS. 2 TO 5—GRINDING ON AN ENGINE LATHE.

internal grinding, and where marked (A) must be long, while for external work it must be short. Fig. 6 shows drum, which consists of two pulleys, keyed to counter-shaft and built up with wood, as shown at (A). A pump will also be required, but that can be arranged to suit different classes of lathes used. In Fig. 1 a general view is shown.

Grinding Wheel Notes.

A few words about grinding wheels will not be out of place here, and an idea of what grinding wheels are made from, and the terms connected with them, are necessary to aid in their proper selection. A grinding wheel consists of crushed abrasive, held together with an adhesive substance known as bond. There are two kinds of abrasives—natural and artificial. Emery and corundum belong to the natural class. Both are mineral substances and alike, only emery is not as pure as corundum, and contains a large percentage of iron, which is an undesirable element in a grinding wheel. In the artificial class we have alundum and carborundum. Both are products of intense heat in an electric furnace. Alundum is made from Bauxete, which is found in France and the Southern United States, while corborundum is made from coke, sand, salt and sawdust. The natural class is of tougher substance than the artificial, while the carborundum crystal is the hardest known excepting the diamond.

All abrasives are screened through sieves of different mesh per sq. in., and the fineness of the particles is designated as grain. Thus a 36-grain abrasive is one that will just pass through a screen having 36 meshes to the sq. in. The adhesive substance is usually composed of either shellac, silicate of soda or clays. The adhesive substance of a wheel has an office other than that of merely holding the particles of abrasive together. It determines how strongly the particles are held together, and this is a very essential factor in the selection of wheels. Wheels from which the grit is readily torn out during operation are known as soft grade wheels, and those that strongly retain the grit are called hard grade. Grade and grain of grinding wheels should not be confused. Grade refers to hardness or softness of the wheel, while grain is used to designate the size of particles of abrasive that enter into its construction.

The theory of action of a perfect grinding wheel is that, as the cutting points wear or become dulled, they will loosen from the bond and fall away from the surface of the wheel, allowing the sharp points that are below to come into action. This uniform wearing of the wheel allows it to cut freely with little heat, and better maintain a given size of the work.

In concluding, I would say, hard grade wheels are best for carbon and soft steel. Medium grade wheels should be used for high carbon steel, hard steel and cast iron. Soft grade wheels should be used for grinding brass, because a hard grade wheel is apt to heat the work, causing distortion and consequent inaccuracy.

POWER PLANT WRINKLES.

By John Thorn.

IN many small plants the engineer will do odd jobs of brick work around the engine or boiler room, and especially so if he has a fireman who is trustworthy and capable of looking after the machines occasionally when the engineer is busy elsewhere.

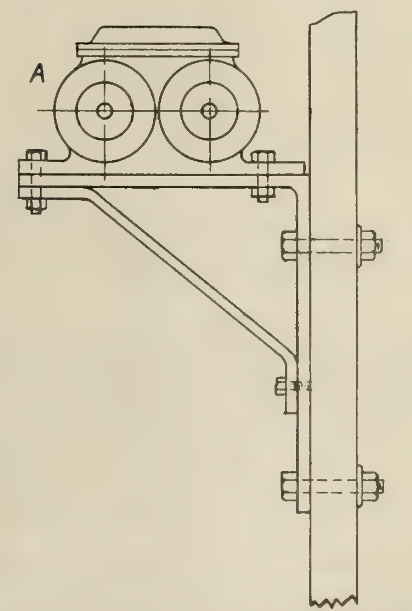

FIG. 1. BRACKET SUPPORT FOR PUMP.

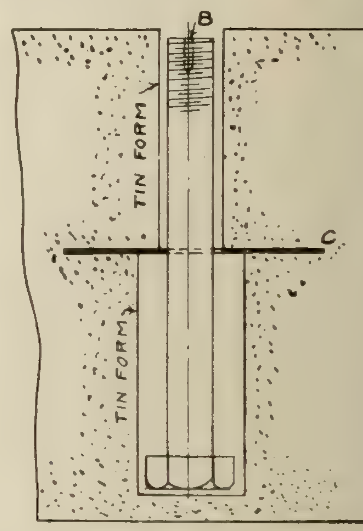

FIG. 2. FOUNDATION BOLT KINK.

Now I imagine it is a mistake for any engineer to do this kind of work unless he understands how to do cement mixing properly, for I believe nothing but cement mortar should be used in foundation work of any kind, brick, stone or grout. Some engineers will build a foundation from the floor up for any and every piece of apparatus, no matter how small, but this is a mistake, as it takes considerable work to keep the apparatus clean, in many cases the foundation making it difficult to get at the bottom of the machine properly, therefore dust or other dirt and oil get a chance to collect.

In the plant where I am at present employed we have several duplex and Northey boiler feed pumps supported by brackets made of iron, as shown in Fig. 1. A glance will show the reader that it is a snap to keep things clean around them. I believe the brackets have been there for about 20 years, for to my own knowledge they have been there 11 years, and so far as I can see they are as good and firm to-day as the day I first saw them.

Another good wrinkle I saw used at the C. G. E. Co. works at Peterboro is shown in Fig. 2. When building a foundation for a heavy machine, the bolts are generally cemented in with the thread end projecting above the foundation the length necessary to pass through the machine base. Should the machine weigh some tons, great care has to be exercised so that while placing it in position none of the bolt threads are injured, and to overcome this danger make two tin forms, or two pieces of iron pipe of the right diameter will do. The bottom one should be big enough to allow the bolt head to pass through and be as long as the depth of the machine base, while the top one should be as long as you wish the concrete to be between the machine and the foundation bolt head. Between the two should be inserted an iron plate with a hole drilled in the centre to allow the bolt to pass through, as shown at (C). At (B) a small hole is drilled and threaded in the centre of the foundation bolt. When the machine is in place, a small threaded rod can be screwed into the hole (B), and the bolt pulled up until the head comes against the iron plate (C). This makes an ideal device to use for a machine which has to be removed at times.

DRILLING MACHINE ATTACHMENT.

By H. Womersley.

RECENTLY we had an order whereby a lot of holes had to be drilled under flanges, as shown in Fig. 1, which shows a valve chest with multiple valves.

Sometimes we have a chest with two valve seats, and sometimes with six valve seats. The way we proceeded to do the job was by making an attachment as shown in Fig. 2.

Attachment Details.

Secure two pieces of mild steel and machine on faces, as shown. Clamp together and drill shaft, column and bridge holes. Next fit the brass bushes in check plates, and do not forget the lubricating holes. Fix collar to feed screw with taper pin. Next make columns or distance pieces, the shoulders on these being so as to just keep gear wheels free.

The combination shaft and socket must be made from good material, owing to its being subject to ill-usage. Make socket to suit No. 1. Fix the intermediate and socket gear wheels with a key to shafts. Make the driving shaft from mild steel, and fit the taper to suit drilling machine spindle. The feather way must be cut the whole length of shaft. Fit the feather in gear wheel.

The feed screw is an ordinary Whitworth thread with a collar fitted on the end and held in position with a taper pin, while the bridge is easy to make, it being held in position by two quarter set screws. The thrust plate is of mild steel, with a hole tapped out to suit feed screw, and made long enough to clamp to steam chest flange.

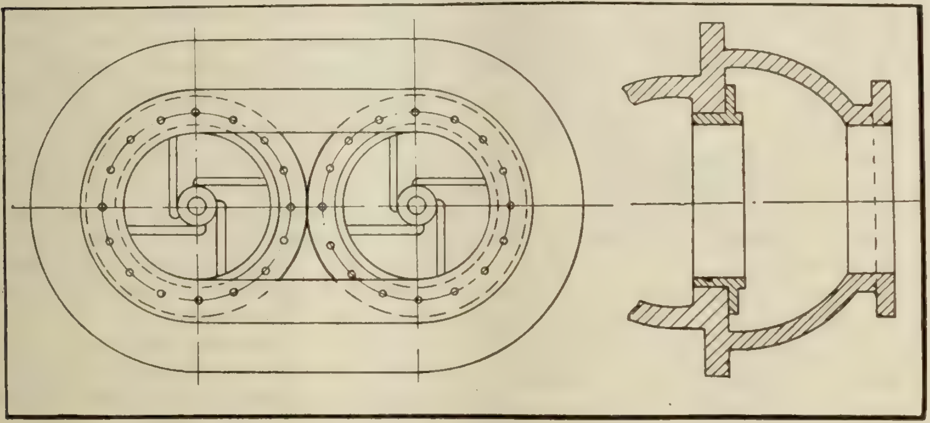

FIG. 1—DRILLING MACHINE ATTACHMENT.

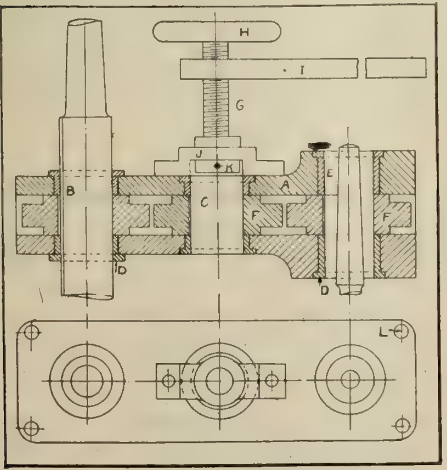

FIG. 2—DRILLING MACHINE ATTACHMENT.

When finished, do not forget to cover gears with planished steel to avoid accidents. All is now ready for drilling. I generally use valve seat as a jig for the holes.

This is a very efficient attachment, and anyone using it will find it a paying investment.

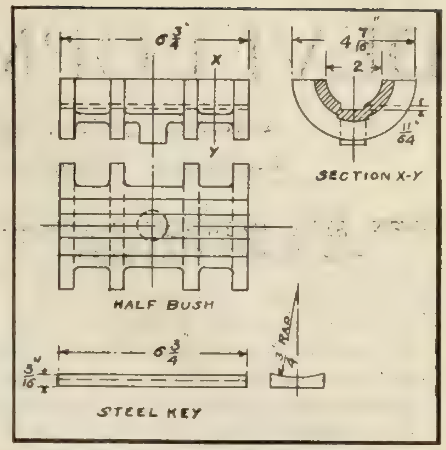
ELIMINATING THE WEAKEST LINK.

By George Black.

IN seeking to operate machine tools at their highest efficiency, commensurate with their depreciation, the weakest link of the chain is constantly in evidence. In that of transmission, we frequently find it in a main drive pulley slipping on the shaft, due to the extra power required to pull the increased speeds and feeds, made possible by the higher efficiency of machine tools and tool steels. The slipping scores the shaft and cuts up the cast iron bush, making it necessary to tighten the bolts.

The capacity to drive is reduced each time the pulley slips, owing to the before mentioned scoring and cutting action, between the shaft and bushing, and the application of emery cloth between them only gives temporary relief, for if the pulley is being overloaded, it will not drive satisfactorily either by increased tension on the bolts or the introduction of emery cloth.



ELIMINATING THE WEAKEST LINK.

The sketch shows a method of effectually eliminating the trouble, which in this case was caused by operating 7-24 in. Bullard vertical turret lathes at their capacity on a particular class of work, and was applied to a 2 in. diameter shaft. The pulley and bush were removed, and in each half of the latter a shallow keyward was cut and key fitted, as per sketch. The point to watch is that the radius of the curve in the key is less than that of the shaft to which it is to be applied. The pulley and bush on being applied to shaft and tightened thereon forces the sharp edges of the key into the shaft and the trouble caused by the overload is transferred to probably the unfortunate belt man.

BOILER EXPLOSIONS FROM SHORTNESS OF WATER.

By William Buchan.

BOILER explosions from shortness of water would be materially reduced if attendants, instead of opening only the drain taps of water gauges, tested them daily in the following manner to ensure that both the steam and water passages were perfectly clear: (1)—Shut top tap. (2)—Open drain tap; a full flow of water shows that the water passage is quite clear. (3)—Shut bottom tap. (4)—Open top tap; a full flow of steam shows that the steam passage is also clear. (5)—Shut the drain tap. (6)—Open the bottom tap; the water should not be sluggish in returning to the glass.

These operations involve a certain amount of trouble, but they ensure that the glass will indicate correctly, and also that the taps can be closed should a glass break. Gauges on water-tube boilers are often fitted with special rods and handles, by means of which the taps can be operated either from the floor or platform at the gauge level. A tail pipe fitted to the drain tap, and provided with a valve near the ground level, is an exceedingly useful adjunct for frequent use, but it does not dispense with the regular routine testing referred to above. Where there are a number of high pressure boilers, the risk of scalding can be greatly reduced if the attendant who tests the glasses wears a mask and gauntlets.

The Holden Co., Ltd., has increased its capital from $45,000 to $250,000.

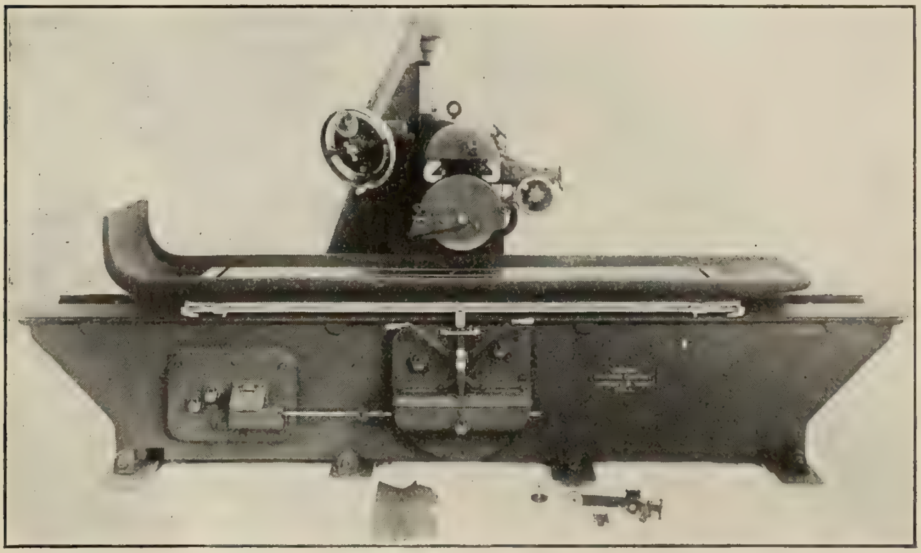
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

OPEN SIDE GRINDING MACHINE FOR PLANE SURFACES.

THE working surface of the table is 15 in. wide and 6 ft., 8ft., 10 ft., 12 ft. and 14 ft. long, depending on the length of machine. This entire surface can be ground in place. The wheel head can be raised to give a distance if 17 in. between the surface of the table and a 14 in. diameter wheel, thus making provision for use of magnetic chuck or supplementary table. The machine is designed to carry wheels 14 inches in diameter, and for the ordinary line of work the wheel would be 6 in. face. For special work, wheels of different widths can be furnished.

Experience has taught that, with grinding wheels, the smaller the arc of contact the more efficient the wheel becomes. Wheels of small diameter are, therefore, advocated. This is especially necessary when grinding plane surfaces, as the arc of contact in that case is much greater than when round work is being ground. For the same reason the periphery and not the side of the wheel is used, as with the side of the wheel (ring wheel) or with large arc of contact of the periphery, there is no opportunity for the chips to escape; therefore, heating, undue power consumption, and general inefficiency results. Further, when for any reason the chips cannot escape freely, a neat appearing finished surface cannot be produced.



NORTON OPEN SIDE GRINDING MACHINE FOR PLANE SURFACES.

A counter-shaft is located in the machine base, making the whole self-contained, and power is transmitted to this counter-shaft through a belt from a motor placed at the side of the machine. All overhead works are eliminated. A 15 h.p. motor is recommended for ordinary work.

The grinding wheel is carried on a cross slide operating at right angles with the travel of table, and in order to secure the large production that is made possible by the use of the wide wheel, no automatic feed of the wheel has been provided, a hand traverse having been designed for locating the grinding wheel so as to utilize the full width of wheel face. Provision is also made through worm gearing for the slower traverse of the wheel when truing the wheel face. The cross slide is carried in a vertical slide, which is designed for raising and lowering on the column by means of a ½ h.p. motor through a lever and friction clutch. For small distances, the vertical traverse is obtained by means of a hand wheel on a shaft geared to the vertical traverse screw, and a micrometer index, which registers in one quarter thousandths, provides for delicate adjustments.

The table is provided with tee slots of standard dimensions, which facilitate the strapping of work directly to the table or the application of a supplementary table, special fixtures, or magnetic chuck. The table traverse is obtained by means of worm gearing of the most approved type, thereby giving the table a perfectly smooth motion, which is absolutely essential for the production of a smooth and accurate surface on the work. The reversal of the table is pneumatically cushioned at the ends of the stroke. All kinds of plane surfaces which are within the capacity of the machine can be ground quickly and accurately. The machine can also be used for grinding a variety of shape surfaces, for which class of work a special forming attachment is used to form the wheel face to produce the shape required.

Ball bearings are employed on all shafts operated by hand wheels, and worm and worm wheel shafts are provided with ball thrust bearings, and all worm gearing runs in an oil bath. Worms and wheel spindle are made of chrome nickel vanadium steel, heat treated, and all shaft bearings are ground and run in self-oiling boxes. Special equipment is used in the scraping of the ways in the base, resulting in such accuracy of alignment that when the table has been ground in place it presents a neat and uniform surface, free from chatter marks, and our inspection requires that a B. & S. straight edge the length of the finished table surface shall hold tissue papers 2 in. apart throughout its length at any angle on the table. The machine is supported on adjusting wedges resting on iron plates which are imbedded in a concrete foundation, making it possible to easily re-align the machine should occasion require. A large water tank is provided with a pump, which will deliver 30 gallons of lubricant per minute on the wheel and work.

With the standard machine are included one grinding wheel, one wheel sleeve, all belting, including the main belt from the motor, a suitable equipment of wrenches, oil cans, etc.; also, the ½ h.p. motor for wheel head traverse. The 15 h.p. motor and electrical equipment for same are not supplied.

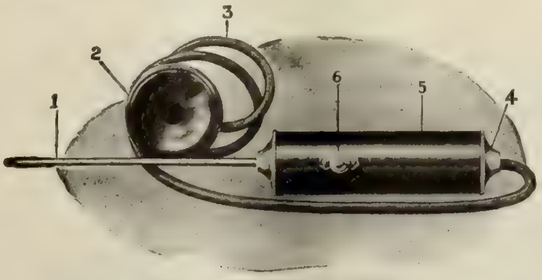
The Norton Grinding Co., Worcester, Mass., are designers and builders of these machines.

◆

THE DETECTORPHONE.

AN instrument that is, perhaps, not as often met with in Canadian power plants as it deserves to be is the detectorphone, an illustration of which appears herewith. As may be seen from the cut, the instrument is an electrical device consisting of a telephone receiver (2), and an extremely sensitive microphone enclosed with a dry battery in a tube (5). Connected with the microphone is a steel rod (1).

The detectorphone is used to investigate conditions existing inside engine cylinders, water pipes, condensers, etc. A small knock that would otherwise be quite inaudible is greatly magnified by the microphone, enabling the engineer to form an accurate opinion of what is going on in the cylinder, valve chest, or other part under investigation. In using the instrument the rod (1) is held against the cylinder, etc., and the receiver (2) is applied to the ear, enabling the minutest sound to be clearly heard.



THE DETECTORPHONE.

It is claimed that a very little practice with the detectorphone renders an engineer wonderfully expert at diagnosing engine ills. By its use small troubles may be early detected and remedied, whereas, if their existence were unsuspected, they might steadily increase until a serious breakdown occurred.

The detectorphone is handled in Canada by the Maihak Indicator Agency, 3 Beaver Hall Square, Montreal.

* * *

IMPROVED AUTOMATIC WATER GAUGE.

THE improved automatic water gauge here illustrated was designed and patented by The Lunkenheimer Co., of Cincinnati, Ohio, who are its sole manufacturers. We understand that quite a large number are already in use, and that they are giving perfect satisfaction.

The water gauge is made in two patterns, termed "Medium" and "Extra Heavy," intended for 200 and 300 pounds working pressures, respectively. They are made either right or left hand, as desired, to facilitate operation.

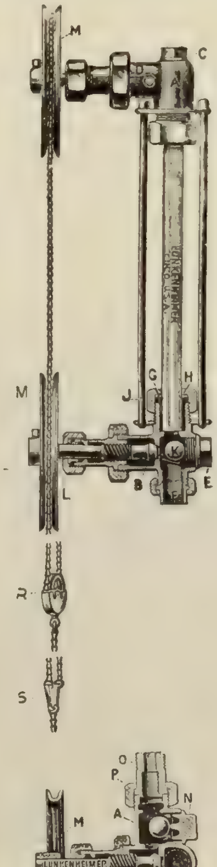
Broken Glass Provision.

Should the gauge glass break, the ball check valves (K) will automatically seat themselves, owing to the rush of steam and water on one side, and the lack of pressure on the other. This automatic closing feature is a valuable one, as it prevents the escape of steam and water, and permits the safe closing of the hand operated valves for the purpose of renewing the glass.

To renew the glass, it is only necessary to loosen the stuffing-boxes (G), take off the cap (C), remove the broken glass and substitute a new one, after which the stuffing-boxes are tightened, and the cap (C) replaced. The change can be performed with perfect safety, for, owing to the quick-closing valves, which should be closed upon the discovery of the broken glass, there is no danger to be anticipated from escaping steam and water.

The Cleaning Feature.

Particular care has been exercised in the design of the gauge to facilitate cleaning, and access can be readily had to any part. The plugs (C), (D), (E) and (N) are provided for this purpose.



IMPROVED AUTOMATIC WATER GAUGE.

By removing the plugs (D) and opening the regrinding valves to their greatest extent, a rod can be inserted entirely through the body and tail pieces, and any sediment that might have collected in or around the entrance of the tail pieces can thereby be easily removed. By unscrewing plugs (E) and (N) the check balls will of their own accord fall from the body, as they rest on inclined surfaces.

Valves Closing Feature.

It has been the practice heretofore to attach both pulleys together by means of a chain or cord, which was pinned to the pulleys, so that the proper closing of one depended entirely on the other. While in some cases this method was satisfactory, it has been found that unless great care was exercised in pinning the chain to the pulleys, or after the valves had been reground several times, one of the valves would not seat properly. To overcome this difficulty, the arrangement illustrated herewith was designed, by which it will be readily seen that both valves can be made to positively seat independently of each other.

The arrangement consists of a block pulley operating over a chain, which is pinned to both the upper and lower pulleys, this method being employed for closing the valves. Should one of the valves become closed before the other, a continued pull on the block chain will close the other. To the left of the pulleys the chain is merely attached to a triangular plate, as the opening of the valves need not be regulated to as fine a degree as the closing thereof.

The valves are constructed on the same principle as the Lunkenheimer well known regrinding valves; therefore, they can easily be reground when worn. The valve seat opening is very large, and consequently a free and unobstructed passage for the water and steam is insured. The gauge cannot show a false level, as the ball checks are so constructed that unless the glass breaks, they will, owing to their weight and position, fall away from their seats.

The Lunkenheimer Company has issued an attractive booklet thoroughly describing and illustrating this gauge, which they are distributing free to anyone desiring a copy. The gauge has been given the trade name of "Monitor."

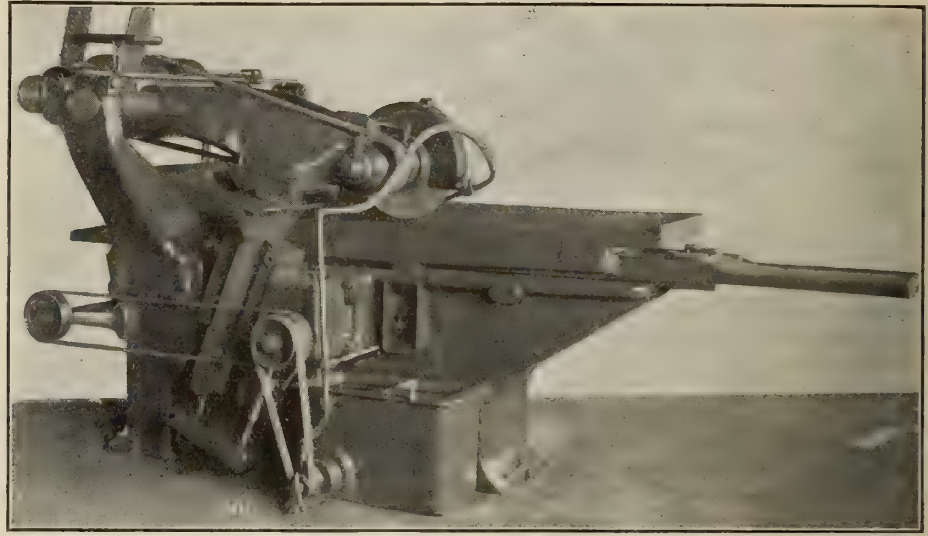
* * *

4 FT. HORIZONTAL SURFACE GRINDER.

THE horizontal grinder which has recently been developed at the Pratt & Whitney Works has been designed for the grinding of flat surfaces, more especially for work with surfaces at various heights and angles. The well known Pratt & Whitney Surface Grinder with cup wheel has been used almost entirely on work where the surfaces to be ground were all in the same plane. There is a great deal of work, however, which cannot be handled with a cup wheel in this manner, due to the fact that the surfaces to be ground are of different heights.

The new Pratt & Whitney Horizontal Grinder has demonstrated, during a series of most severe tests, that it produces work very accurately, and is also very rapid. The results obtained are largely due to extreme stability throughout, coupled with the use of a large, correctly supported and powerfully driven wheel, so designed that a liberal supply of water may be utilized during the grinding operation.

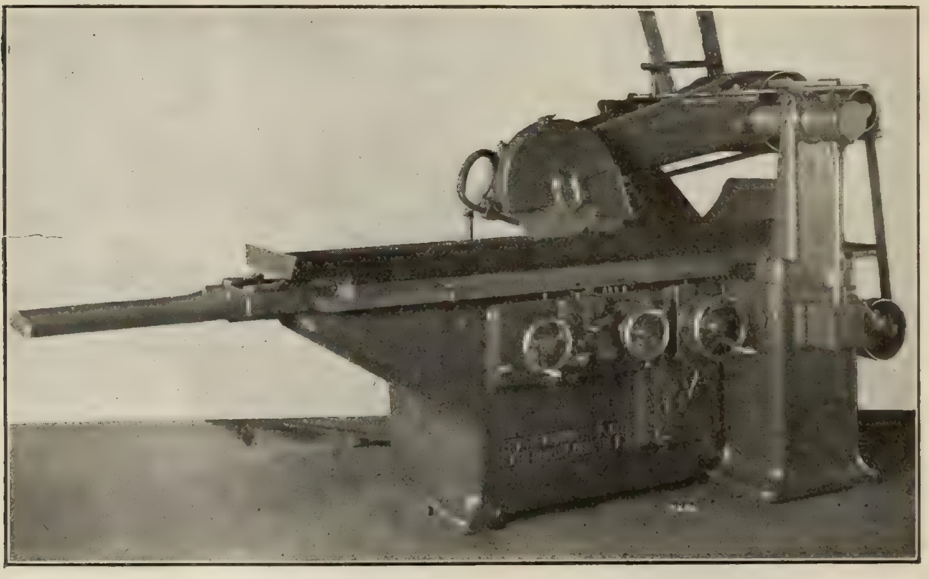
The bed is massively proportioned and internally braced in a manner to insure ample rigidity and permanent accuracy. It is very compact in design, the various units being located in a manner to be easily accessible. Wide bearing surfaces of the "V" and "Flat" type are provided. Oil reservoirs for the automatic oiling of the ways by means of rolls are located in the bed. The pan which surrounds the rear of the bed for collecting the water and receiving the chips is of liberal proportions, and is easily accessible for cleaning.



4 FT. PRATT & WHITNEY HORIZONTAL SURFACE GRINDER.

The table has been made amply heavy, and, furthermore, is powerfully ribbed in a manner to prevent warping and to resist torsional strains. It is provided with guards at each end, to cover and protect the bearing surfaces from injury. A spacious pan is cast integral with the table for controlling the water.

The table is provided with automatic reciprocating motion, any length of stroke up to four feet being readily obtainable by means of adjustable table dogs. The table feed mechanism is of substantial design. Two table feeds are provided, both of which are instantly controlled by means of a lever conveniently located at the front of the machine. This lever when adjusted to the central station also serves as a means for stopping the table. The table is driven through a rack and pinion vertically located



4 FT. PRATT & WHITNEY HORIZONTAL SURFACE GRINDER.

The machine is provided with both hand and automatic horizontal feed. While both the table and horizontal wheel power feeds are engaged through the same trip, the feed units are entirely independent of one another. The feed mechanism operates a screw mounted within the hollow arbor upon which the arm is mounted. The screw engages a nut clamped firmly to the arm. Both the screw and the nut are of liberal proportions and easily accessible. It will be observed that the feed mechanism is entirely enclosed, so that it is impossible for emery or dirt to injure it in any way. Any variations of feed are readily obtainable by means of a ratchet wheel and pawl. The feed is operative in either direction, it being governed merely by the direction in which the feed pawl is engaged. A safety is also provided, which prevents injury to the feed mechanism in case the arm should come into contact with the uprights, due to neglecting to disengage the feed mechanism.

The vertical wheel feed is through hand only, a large graduated dial being provided whereby it may be very accurately gauged. The semi-vertical ram by means of which the wheel is raised or lowered, is rigidly supported in long bearings. The construction is such that this ram is raised or lowered by means of a heavy screw and nut, the screw being driven through a worm and worm wheel, actuated by the hand wheel. On top of the ram a hardened and ground plate is mounted, which engages a similarly treated block on the under side of the arm.

A most important feature is the method of mounting the wheel in an arm, which entirely eliminates the slide construction. The arm has a perfect fit on an arbor, which is substantially supported upon two uprights. Both the arm and the arbor are proportioned so as to insure absolute strength and rigidity. With this construction the wheel is adequately supported without overhang.

The spindle is of tool steel, hardened, ground and lapped, special treatment and care being exercised to insure the highest possible efficiency of this important member. The boxes, made of bronze, are mounted in conical seats. Extra precautions have been taken to insure proper lubrication, large, self-feeding oilers being provided.

The wheel mount is self-contained and constructed so as to hold the wheels firmly and perfectly true. The spindle end has been made conical and provided with a key for the accommodation and positive driving of the wheel mount.

The machine is designed with a view to using wheels up to 18 inches diameter and 2 inch face. Suitable packing rings, however, are provided, which permit the use of wheels as thin as 1 inch face.

The wheel spindle drive is of liberal proportions throughout, so that there is no question but that the wheels will have sufficient power for any requirement. Two wheel speeds are provided by means of a two-grade cone, so that when the wheel is reduced by wear its speed may be increased. The mechanism for shifting the belt to obtain the increased speed of wheel is so designed that it also becomes necessary to proportionately decrease the table feed, consequently the table feed is always constant, regardless of whether the fast or slow wheel speed is being utilized. The wheel is driven from a drum which is finished perfectly true, so that there is no vibration to the machine.

A feature in these machines is the liberal and perfectly controlled water supply. It is well known that in order to keep the wheel free and prevent clogging, also to prevent the heating of the work, a liberal supply of water is absolutely necessary. The type of pump is made and located in a manner to entirely dispense with the usual idler pulleys. It is capable of supplying an abundance of water, ample to meet any requirement. An exceptionally large water tank is located on the back of the machine in an accessible position where it may be readily cleaned. It also permits the return of the water without it being carried through pipes.

PRENTICE SYSTEM OF WIRELESS TRAIN CONTROL.

WE had the opportunity, says "Engineering," through Mr. G. A. Phillips, of 4, Bishopsgate, E.C., of inspecting recently a demonstration installation of the Prentice automatic system of "wireless" train control, on the Hampton Court Branch of the London and South-Western Railway. In this system the track is divided into a number of insulated sections, in each of which a low-voltage track circuit is arranged, with, in addition, a high-tension wave wire running between the rails. At the end of each section is a box containing the high-frequency plant for the supply of current at 20,000 volts to the wave wire.

This plant is controlled by a relay in connection with the track circuit of the section ahead, with the result that if that track circuit be short circuited, the controlling relay is de-energised, and the supply of high-tension current to the wave wire ceases. The locomotive is fitted underneath with an arrangement of wires equivalent to the antennae of the ordinary wireless apparatus. These receive the energy transmitted from the wave wire, and by means of a system of coherers and relays in the cab, a green "line-clear" signal is provided for the driver if the section ahead is unoccupied. If, however, the section ahead be short circuited, the wave discharge and a red light is shown and a buzzer simultaneously sounded, while the brake is at the same time applied, these operations being effected by power obtained from a battery in the cab. Provision is made to enable the driver to release his brake, but the red light and the buzzer continue until the section ahead is cleared, when the high frequency supply is re-established and normal working is resumed.

The system, therefore, provides for a continuous danger signal on the locomotive so long as the line is not clear, the automatic application of the brake and a prompt intimation of the restoration of line clear conditions. In the event of failure of the high tension, or the track circuit, danger indications would be given. The operation of the cab apparatus naturally depends on uninterrupted battery supply. The demonstration was quite successful, the train being brought up on every trial by the automatically applied brake, although the regulator was untouched.

The system requires electrical supply to all the section-boxes, and transformer plant in each section-box, in addition to the boxed-in high-tension wire between the rails and the apparatus on the engine. The expense question is, therefore, one which will have to be seriously considered before the system is likely to be largely adopted. In addition to initial cost the working cost must also be taken into account, the power taken by a half-mile section being about 1 horse-power.

BRITISH FIRM SECURE U.S. CONTRACT.

A BRITISH builder, on September 11, was awarded the contract for turbine drums for the newest American battleship, No. 39, at a little more than one-third the price offered by the lowest American bidder. The accepted bid, $57,436, was submitted by New York agents of the Cyclops Steel & Iron Works, Sheffield, England.

It is exceptional for the Navy Department to send a contract abroad, but Acting-Secretary Roosevelt held that the action to-day was justified by the tremendous difference between the British and American prices. The Sheffield bid includes the payment of duty, and by giving the work to the foreign builder the United States saves more than $100,000.

There were two American bidders, the Bethlehem Steel Co., $169,568, and the Midvale Steel Co., $160,272. The Carnegie Co., the only other domestic concern equipped to build the drums, did not seek the contract.

METALS FOR STRUCTURES.

WHAT follows is a short abstract from a paper to be read this month by A. T. Walmsley, before the Engineering Section of the British Association for the Advancement of Science.

Alloys are not mere mechanical mixtures, but homogeneous combinations, secured by fusion, possessing distinguishing qualities for special purposes.

Copper possesses the element of conductivity. It is always economical to use the purest copper obtainable commercially, especially for electrical purposes.

Zinc is applied for coverings. Galvanised sheets can be tested with sulphate of copper, which will adhere to any exposed surface of the iron not coated with zinc. The durability of zinc depends mainly on the spelter from which it is made.

Lead has no elasticity, but is useful for girder seatings, where the weight is sufficient to crush the lead so as to produce uniformity of pressure upon the bearing. It is also serviceable for roof coverings and for flashings.

Brass, consisting of copper and zinc, is employed for lubricators and pumps, while Muntz's metal, also an alloy of copper and zinc, has superseded copper for sheathing vessels.

Manganese bronze, an alloy of copper and ferro-manganese, is serviceable for propeller blades, on account of its toughness; and ordinary bronze, an alloy of copper and tin, is found to possess sufficient fluidity for satisfactory melting, combined with slightness of contraction on solidifying.

Phosphor bronze, by the addition of phosphorus, excels ordinary bronze in hardness, density and tensile strength, and is used for friction bearings, especially when liable to shock; also for sliding surfaces in the case of steel shafts, as a steel or wrought iron shaft would grip a certain bearing.

Gunmetal, another alloy of copper and tin, takes its name from its employment as the metal from which large guns were formerly made, while bell-metal and delta-metal also possess characteristics described in the paper.

When one metal less oxidisable than another comes in contact, galvanic action may be set up. In the case of mild steel and wrought iron in metallic contact, the steel may oxidise at the expense of the iron.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World

SOO CANALS TRAFFIC.

FOLLOWING is the statistical report of traffic passing through the canals at Sault Ste. Marie for the month of August:—

Eastbound.—Copper, short tons, 18,964; grain, bushels, 9,211,920; flour barrels, 1,437,364; iron ore, short tons, 7,461,384; pig iron, short tons, 2,414; lumber, million feet board measure, 105,166; wheat, bushels, 6,836,614; general merchandise, short tons, 57,958; passengers, number, 12,731.

Westbound.—Coal, hard, short tons, 383,847; coal, soft, short tons, 2,566,320; flour barrels, 400; manufactured iron, short tons, 37,193; iron ore, short tons, 9,136; salt barrels, 113,136; general merchandise, short tons, 212,770; passengers, number, 13,856.

Summary.—Vessel passages, number, 3,440; registered tonnage, net, 8,033,353; freight, eastbound, short tons, 8,263,273; freight, westbound, short tons, 3,226,169; total freight, short tons, 11,480,442.

Grain at Kingston.—So far this season, the Montreal Transportation Co's elevator at Kingston, Ont., has handled 7,248,010 bushels of grain, nearly two million bushels more than at the same time a year ago. The grain carrying trade has been very steady all summer. A busy fall is expected.

ONTARIO'S MINERAL OUTPUT.

ONTARIO'S mineral production for the first six months of this year shows a large increase. From returns made to the Bureau of Mines, the gain in metalliferous ores amounts to about three and three-quarter millions of dollars, the total being $18,598,804. Gold, of course, heads the list with a gain of $1,935,949, while silver shows a falling off of $242,887, and cobalt and nickel oxides of $5,726.

In addition to gold, there is an increase of $96,176 in copper, $347,519 in nickel, $108,264 in iron ore, and $1,109,202 in pig iron. These increases are all derived from comparison with the production for the same period in 1912. The detailed production is as follows:

	Quantity.	Value.
Gold, ounces ..	106,091	$2,171,147
Silver, „ ..	13,890,692	7,693,713
Copper, tons ..	5,873	832,645
Nickel, „ ..	12,104	2,514,414
Iron Ore, „ ..	62,627	141,324
Pig iron, „ ..	369,450	5,051,840
Cobalt ore, tons	79	7,374
Cobalt & nickel oxide, tons ..	404,060	186,347

Porcupine the Gold Centre.

Most of the gold, says the report handed out by Deputy Minister of Mines Gibson, came from Porcupine, the chief producers being the Hollinger and Dome Mines, both of which have been steadily at work. Porcupine Crown and McIntyre Porcupine also contributed. The other gold camps yielded about $150,000, including Swastika, Cordova in Hastings county, Canadian Exploration at Long Lake, Northern Gold Reefs at Sturgeon Lake, Goldfields, Limited, at Larder Lake, and Tough-Oakes at Kirkland Lake. The narrow veins in the last-named camp are proving to contain rich ore.

Greatest Silver Producers.

The most productive mines for the half year were the Nipissing, Coniagas, La Rose, Kerr Lake, McKinley-Darragh-Savage, Buffalo and Crown Reserve, all mines which have held a leading place for years. Cobalt Townsite, Casey,Cobalt, and Seneca Superior are coming into prominence as producers, while some properties, formerly in the first rank, are falling off in their yield.

Shipments of ore were 3,216 tons, of concentrates 8,253 tons, and of bullion produced at the mines 2,792,311 ounces. The corresponding figures for the first six months of 1912 were: Ore, 6,860 tons; concentrates, 4,806 tons; and bullion, 2,448,689 ounces, showing the progress being made towards complete treatment of the ore on the spot. Three mines in Gowganda and South Lorrain yielded 407,103 ounces.

Nickel and Copper.

The mines in the Sudbury district continue to increase their output, and the outlook is for still further production. The Canadian Copper Co. and the Mond Co. remain the sole producers of matte. Recent drilling operations have proven the existence of very large ore preserves. The Alexo mine, on the Porcupine branch of the T. & N. O. Railway, is interesting as being separated about one hundred and forty miles in a direct line from the Sudbury mines, and so proving the existence of ore quite outside the older field. The shipments are made to the Monde Co.'s new smelting plant at Coniston, which came into operation during the half year.

Pig Iron Production Grows.

The production of pig iron in Ontario is growing rapidly. In 1902 it amounted to 112,687 tons. In 1907 to 286,216 tons, in 1912 to 589,583 tons, and at the present rate of production if maintained for the remainder of the present year, the output will be 738,900 tons. All the blast furnaces except the one at Port Arthur were in blast during the six months.

GRAIN STORAGE RATES.

VARIOUS opinions have been expressed by shipping men with regard to the announcement that the Government had approved a by-law adopted by the Montreal Harbor Commissioners, increasing the rates to be charged for storing grain in the elevators of the port, including not only the Harbor Commission elevators, but the Grand Trunk elevator also. Some were of opinion that the increased charges would tend to discourage the speculative holding of grain; others that the probable effect would be to divert still more Canadian and Western American grain by way of Buffalo, instead of Montreal, a view that has been expressed before now by more than one prominent port official.

A view of the grain trade in general which was expressed is to the effect that however beneficial the grain trade and its transit by way of Montreal and the St. Lawrence may be to Canada, it is not of much benefit to Montreal as a port. In this connection it was pointed out that the handling of most kinds of merchandise exported results in about a dollar per ton being expended in the port, but that, in the case of grain, the benefit to the port is almost nil. Shipping men, however diverse the opinions they may hold, are all awaiting the result of the increased rates with considerable interest.

A NOTE OF PROSPERITY.

WITHIN a week or two the Canadian Furnace Co. will commence operations at its new plant, which has recently been completed in Port Colborne at a cost of about two million dollars, and an official opening will take place some time between September 20 and 30.

Such was the announcement of Mr. W. P. Fitzsimmons, general publicity agent of the Grand Trunk, who when interviewed recently, expressed surprise at the remarkable industrial growth throughout Canada. "The completion of this large plant and the commencement of operations,'' said Mr. Fitzsimmons, ''is evidence in itself of growth and advancement in Canadian industry.''

''It is a surprise to me,'' continued he, ''inasmuch as I believed the so-called money stringency would handicap industry to no small extent, but only recently I have travelled from coast to coast, and everywhere I have been there is no sign of business being brought to a standstill.''

''Other indications of growth and prosperity are numerous,'' stated Mr. Fitzsimmons. Additional tracks are being laid in Berlin by the Grand Trunk for the use of the Dominion Tire and Rubber Co. ''This company will also carry on an extensive business, and will consequently send industry up another notch,'' continued he. ''Then the Union Carbide Co. of Niagara Falls is extending its business by installing additional branches.''

Motor Industry Grows.

''The automobile industry in and around Windsor is not only holding its own, but is making rapid strides, and this year's business will undoubtedly surpass that of any previous year.

''As far as the West is concerned, I am most optimistic, and I believe that is the feeling of the Westerners themselves.'' Visiting a large area of the West, Mr. Fitzsimmons is undoubtedly in a splendid position to size up conditions in general. He stated that everywhere he went crops were good. There is plenty of money, he stated, for legitimate business, and he felt that real estate would not go beyond bounds as it had done before.

G. T. P. COMPLETION.

PRESIDENT E. J. Chamberlain, of the G. T. P., who passed through Winnipeg after a trip of inspection over the western line, and to Prince Rupert, whence he inspected construction eastward from the coast, stated that it is now recognized as impossible to complete the line through the mountains to the coast by the end of 1914 as expected. Unforeseen difficulties, of which he did not give details, have delayed construction. Mr. Chamberlain did not make any statement as to when he expects the line to be completed.

DECLINED 3.8 PER CENT.

COMPLETE returns of Canadian railroad earnings for August bear out the predictions made recently that the month would show a decrease compared with 1912. The gross receipts of all roads reporting fell 3.8 per cent. below last year, that being the first instance in years that a decline had been registered.

It compared with a loss of 1.2 per cent. for the first three weeks of the month, an increase of 2.3 per cent. for the whole of July, 6.1 per cent. in June, 7.5 per cent. in May, 7.6 per cent. in April, 7.8 per cent. in March, 4 per cent. in February, and 20 per cent. in January.

The continued losses in the C. P. R. returns are responsible for the poor exhibit, for the other lines have had a steady increase.

OBJECT TO I.C.R. INCREASES.

MEMBERS of the Government have received copies of a very strongly worded protest by the Maritime Board of Trade against the increase in Intercolonial Railway freight rates. The argument advanced is that the construction of the road was incidental to the Confederation pact, and that, in view of the surrender by the provinces of the right of indirect taxation, it should not be operated with the idea of producing surpluses.

The resolution speaks of the lower provinces having given their blood and brawn, and concludes with a protest against the '' insidious efforts '' of Governments, Liberal and Conservative alike, to make the I.C.R. a surplus-producer.

CANADA AND THE WEST INDIES.

SOME very interesting statistics are contained in a booklet published by the Imperial Department of Agriculture, and distributed at the Toronto National Exhibition, regarding the trade between Canada and the West Indies. The Commissioner of Agriculture for the West Indies states that the value of Canadian imports into the British West Indies and British Guiana amounted in the year ending March 31, 1912, to $4,617,961, while the value of the exports from the West Indies to Canada was $10,550,491.

The total volume of the trade carried on between the two countries during that period was, therefore, $15,168,452. In the year 1912, British Guiana exported to Canada produce, mostly sugar, to the value of $3,472,531, while the imports of Canadian goods were worth $583,536. From Barbadoes, in 1912, sugar to the value of $1,256,261, and molasses to the value of $1,264,651 were sent to Canada, and imports of the value of $882,240 received.

The value of the imports from Canada into Jamaica in 1911 was $1,169,143, or 8.5 per cent. of the total imports, and the value of the exports to Canada from Jamaica was 8.6 per cent. of the total exports, as compared with 8.4 in 1910, and 4.7 in 1909.

Trinidad in 1911 sent exports to the value of $989,438 to British North America, and received imports of the value of $913,378. These figures show that a very considerable trade has already been established.

UNTREATED POLES.

MUCH attention has been drawn lately in Canada to the heavy loss sustained annually by the use of telephone and telegraph poles untreated with creosote or any other preservative. The number of new poles required in Canada to replace decayed poles is stated to be about 600,000 per annum. Practically all of these are now put up untreated. The estimated life of poles of Western red cedar, untreated, is ten years; brush treated with creosote, thirteen years; and tank-dipped, twenty years. With Northern white cedar, the periods are fourteen years, seventeen years, and twenty-two years respectively; and with Western yellow pine, three, five, and twenty years.

It has been computed that if all the poles used in Canada for telegraph and telephone work were treated with creosote, a saving of upwards of 260,000 poles per year would be effected. The practice of tank-dipping new poles will, it is believed, be adopted generally in Canada, now that the advantage of so doing has been demonstrated.

GRAIN BLOCKADE AT MONTREAL.

THAT the grain blockade, which is said to have occurred at Montreal, will have no effect on the movement of the western grain crops, more than to cause a great deal of it to be shipped by way of American ports instead of Canadian ports, is the statement made by W. B. Lanigan, assistant freight traffic manager of the C.P.R.

Mr. Lanigan points out that, with a blockade at Montreal, it would be impossible to ship large quantities of grain there from Fort William, because it could not be taken care of. Therefore, most of it will be sent down to New York by way of Buffalo and other American routes.

Speaking of the movement of the western crop which has already commenced, Mr. Lanigan stated that since September 1, no less than 633 carloads of grain had been loaded on C.P.R. lines. Mr. Lanigan drew attention to the fact that the movement has started in fairly heavily.

RESTRICTIVE CONTRACT CASE.

AN interesting case of restrictive contract is being presented in the Montreal civil courts. John Berry was at one time employed by the Canada Metal Co. of Toronto, having a contract with them which stipulated that he should not, in the event of his leaving their service, enter the service of any other firm in the same capacity within the period of a year. Berry left the Canada Metal Co. and went to Montreal, where he signed with Cuthbert & Son.

The former seek an injunction to prevent Berry from working with the latter firm, claiming that as he knows many of their secret processes, the breaking of his contract means a serious loss to them. It is questioned whether the contract is legal, since it binds a man not to engage in the only trade by which he can make his living. A somewhat similar case occurred a year ago—that of a hockey player who left the Nationals and joined the Wanderers.

CANADIAN FREIGHT RATES.

W. BLACK NOBLE, writing to the "London Times" on the subject of Canadian freight rates, and with particular reference to the mission of H. L. Drayton, Chairman of the Dominion Railway Board, who has met him, expresses the opinion that the Canadian Government would be adopting a sounder policy if, instead of advocating State control of ocean rates, they would consider the question in a more general sense apart from the Canadian millers.

Flour Rate Excessive.

The contention is that the rate on flour is excessive as compared with grain, and that the existing preferential tariff is practically neutralized by the exorbitant rates on westbound goods. He describes it as incredible that any body of right thinking men could entertain such proposals as are being put forward, namely:

1—That ocean carriers should be treated as, and if necessary legislated into, the position of common carriers.

2—That the Canadian Government should form a fleet of vessels of their own for the conveyance of eastbound produce and westbound merchandise.

3—That powers under the three-mile limit of territorial jurisdiction should be exercised in connection with steamers trading to Canadian points.

It would be much better, concludes Mr. Noble, if instead of spending money in establishing a State Department, a very dilatory and inefficient method of attaining their object, they employed money in forming a fund for subsidizing merchants who were unable to carry on profitably a business which is necessary to the well-being and prosperity of the country.

Means Trade Restriction.

By dealing with the situation in any other manner, the inevitable result would be the restriction of export and import facilities, an eventuality which for a growing country like Canada, ought not to receive the most passing consideration on the part of those entrusted with the management of her business.

MONTREAL HARBOR BOARD AND GRAIN TRADE.

VARIOUS tables of statistics having been quoted in support of the contention that the Harbor Commissioners of Montreal should provide more storage facilities at that port for grain, tables which differ almost as widely from each other as from the facts, the suggestion has been made that the official figures of grain trade for the port should be republished.

In 1898, the export trade of the port in grain was over 40,000,000 bushels for the year. From that date grain exports steadily declined until, in 1905, the official return showed that the volume of business done was only 13,455,413 bushels. From 1905 there has been an increase, until last year the figures nearly rose to those attained during 1898. The details for each year of the increase are as follows:—

1906	28,812,607
1907	32,783,018
1908	31,421,082
1909	27,959,395
1910	26,859,268
1911	29,893,184
1912	38,918,264

From the above figures it will be seen that the increase since the lean year of 1905 has been irregular and fluctuating; but the indications are that the figures for the present year will top those of 1898, a fact which lends point to the contention of grain exporters that further storage facilities should be provided. Their demand is being considered by the Harbor Commissioners, who have consulted the exporters as to the site of a new elevator, whenever its erection shall have been decided upon. The Harbor Board will likely arrive at a decision shortly, and the announcement of that decision may be made soon afterwards.

C. G. E. ACQUIRE STRATFORD MILL BUILDING CO.

SOME time ago the Canadian General Electric Co. acquired by agreement with the Allis-Chalmers Co. of the United States, the right to manufacture and sell exclusively in Canada their various lines of manufacture. The Canadian General Electric Co., at their various works, have sufficient equipment for manufacturing most of the apparatus for which these rights were acquired, such as hydraulic machinery, saw mill machinery, mining machinery, etc., but had no equipment for the manufacture of flour mill machinery, grain elevator equipment, etc., such as manufactured by the Allis-Chalmers Co., and in order to be fully equipped to take care of all business offering in this line, the Canadian General Electric Co. have just acquired by purchase all the plant and assets of the Stratford Mill Building Co., at which plant, in future, will be manufactured not only the well-known lines of flour mill machinery heretofore manufactured by the Stratford Mill Building Co., but also the wider range of machinery and equipment as produced by the Allis-Chalmers Co.

Mr. William Preston, who has been the President of the Stratford Mill Building Co., will continue actively identified with the flour mill machinery business as manager of the flour mill machinery department of the Canadian Allis-Chalmers Co.

STEEL CO. OF CANADA AT FORT-WILLIAM. N

G. O. CALLAGHAN, managing director of the Steel Co. of Canada, while in Fort William recently, inspecting the big plant of this company now under construction, stated that, under ordinary favorable conditions, the Fort William plant would be ready to begin operations on April 1, 1914.

Prack & Perrine, Hamilton, the contractors in charge of the building operations, have a large staff of men at work, and will be putting on a larger staff in a short time to make even better headway than has been made. It is intended to have the building closed in before real winter sets in, so that there will be no delay in the construction work until the completed structure is turned over to the owners.

LEAD ALLOY FOR TAPES.

THE Western Electric Co. has patented the following alloy in England. It is intended for use in the form of tape for winding electrical conductors:

Lead	95.00%
Antimony	4.50%
Tin	.50%

It is stated that the tape made from this alloy is more economical than pure lead, for the reason that the thickness may be reduced one-half, the width increased by one-third and the same strength obtained.

FREE SUPPLIES TO STUDENTS.

A RECENT decision of the Advisory Industrial Committee of the Board of Education makes free, to all pupils in the first year industrial course at the Toronto Technical School, books, drawing instruments, science supplies and lockers. Despite a strong protest on the part of one member of the committee, the proposal, which originated with the principal, got the necessary support for its enactment.

To our mind the step is a retrogade one, and gives abundant evidence of the lack of appreciation of human nature as found in our industrial workers, or for that matter, among any body of civilized people, on the part of those who supported the proposal. The principal's plea that, by adopting the scheme, classes unfilled would receive the necessary complement, has no foundation in fact or experience, and he forgets that while it looks well to see a report in the public press that no more students can be enrolled, his business and the purpose of the school is not to pack or herd human beings together, but to teach and train them.

The decision anent the already mentioned equipment is nothing more or less than cheap philanthropy, yes, gallery play, and were its results no more hurtful or impressive than these, the affair would not be worth even passing notice. There is, however, a serious side to the matter, the pauperizing feature, and beyond that again is the certain tendency to indifference to any instruction given, because of there being nothing really tangible at stake on the part of the individual. If a student pay his fees and buy his equipment, he does so with some determined purpose in view, and although many, even under these conditions, fall away later from their ideal, there is more hope of a larger percentage making good than under a regime where something is bartered for nothing.

We all sympathize with the student who is apparently barred from participating in the benefits and privileges of the technical school because he lacks the seven dollars, but we do him more injustice still if we make him a pauper. The lad who is in earnest about his education, or about anything, as a matter of fact, will get there, if left to himself, and while he may not get there just when he wants, he will be none the worse but a whole lot the better for it, as it will have put some real manhood into him. None of us get what we want, nor when we want it, and in taking ourselves to task on the subject we must all admit that we are better as a consequence. Bribing a boy with supplies will, in no shape or form, educate, and if education is worth anything to-day, and if those who are responsible for its imparting knew their business, then a higher standard of manhood should be the goal.

Another aspect of the technical education question is that exemplified by teachers giving their services gratuitously. More philanthropy, you say. Yes, and equally futile. In this twentieth century we had believed that the veriest child realized that there was no such a condition in our economy as something for nothing, yet, here in Toronto Technical School there have been teachers giving their services free, with the result that the management has become dissatisfied. We have all got to be bound down to our task, and a reward for the latter takes away most of the irksomeness involved, but where philanthropy reigns, the loosening of the binding feature proves the only reward, and the performance suffers. This wholesale disregard of the real place and function of our technical school is, to say the least, appalling, and occasions no surprise among those who know the circumstances under which our youth are being trained and educated, not only to take their own place in the march of progress, but to bring our country, at least, on a competitive level with other industrial nations.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, September 15, 1913.—The machinery trade reports a fairly satisfactory week, and most houses state that up-to-date the volume of business transacted is considerably in advance of the corresponding period in 1912; in fact, one large firm have already passed the total for the whole of last year. No particularly large orders were placed last week. The Canadian Pacific Railway Co. purchased a small amount of roundhouse equipment, but apart from that there is little to record. However, some encouraging inquiries were received, and these may lead to some good orders later. At present interest centres on the equipment for the Atlantic Sugar Refineries' plant at St. John, N.B. The tenders have been sent in, and the placing of the orders is being anxiously awaited.

Pig Iron, Copper, etc.

There is a brisk movement in English pig iron at present, purchasers buying freely in view of present low prices. Many are now beginning to lay in winter stocks before the close of navigation, now only some ten weeks' distant. Prices remain firm at last week's figures. No further developments have as yet taken place in the affairs of the Canada Iron Corporation, nor are any expected for some little time.

Copper had a slight reaction in the middle of last week, but has now returned to its former price. While labor conditions in the Lake district are said to be much quieter now than they were a short time ago, production is still very much below normal, and if consumption continues to increase at its recent rapid rate, the price is likely to rise considerably higher than it is at present. Some alarmists even prophesy 20 cent copper in New York before the close of the year.

Tin remains unchanged, with very little business offering. Lead shows a tendency to become firmer. Supplies for immediate delivery are scarce.

Toronto, Sept. 16, 1913.—The market for machine tools is distinctly better this week. Messrs. A. R. Williams & Co. claim to have received more enquiries during the past week than for a month, and other dealers are equally optimistic. Principal enquiries are from The Arnold Co., 105 Lasalle Street, Chicago, who are buying a large lathe, drill, shaper and a pipe machine for the Algoma Central and Hudson Bay Railway. The Arnold Co. secured the contract from this firm on a previous occasion for about fifty machine tools. The Department of Works of the City of Toronto are buying a shaper, drill, lathe, screw cutting gears, emery wheel stand, etc. The contract for about $10,000 worth of machine tools for the Abitibi Pulp and Paper Co., of Iroquois Falls, Ont., was divided between Williams and Wilson, of Montreal, and the A. R. Williams Co., of Toronto. The John Inglis Co., engine makers, Toronto, who are extending their plant, are in the market for seven or eight large machine tools. Henry Hope & Sons, of Peterborough, Ont., the English firm who are building a plant in Canada for the manufacture of steel sashes, are also buying a large number of tools.

Pig Iron and Steel.

There are dealers in Toronto fully convinced that the steel business in Canada will not revive until spring. On the other hand, there are some who expect a revival before Christmas. People with stricter credit are getting business now which was lost by them to those with looser credit some months ago. Import business is still light, business being done mainly in lighter stuff, such as boiler tubes, which are in great demand at this time of the year for winter repairs. It is stated on good authority that a reduction in mill prices may be expected very soon, owing to severe competition. Considerable warehouse business is being done in galvanized sheets. Stove and agricultural men are not buying as readily as was expected. Business on the whole, however, is not nearly as bad as it was this time in 1907. As for building, opinions vary again. Some people think it will fall off considerably, while others think it will be heavy. It is significant that concerns with plenty of capital are planning extensions to their premises on the theory that if this is to be a bad winter, it will be a good opportunity to prepare for the good times ahead. No changes in price have taken place. Messrs. Drummond McCall & Co. are off the market for pig iron. In the supply business considerable heating and steam goods are being bought, and pipe is in great demand. The record of a large supply house's sales during the past week shows the above lines to predominate.

Metals.

Business is quiet, but the market is steady. Several local firms report a fairly good week, chiefly in copper, most of which was for casting. The only change of any significance is in tin, which rose a cent a pound. Under the heading of old material, No. 1 composition turnings are up a cent. No. 1 wt. iron is also a cent dearer, and heavy lead brings 25 cents a cwt. more.

INCREASE GRAIN STORAGE NEXT YEAR.

A STATEMENT has been given out at the offices of the Montreal Harbor Commissioners to the effect that the Commissioners, after carefully considering the representations made by the deputation of grain exporters who waited on them and others, recently, had decided that the grain storage facilities of the port would have to be increased; but a commencement will not be made with the work before next spring, at the earliest. As to whether the programme of extension will include the erection of a new elevator is not yet certain, but, in any case, further additions will be made to the existing elevators controlled by the Harbor Commission.

STRONG SOLUTIONS FOR ELECTRO-GALVANISING.

THE zinc salt employed almost exclusively for electro-galvanising is the sulphate. This is the cheapest of any salt that can be used for the purpose. The only other modification employed for the electro-deposition of zinc is a cyanide solution which is now and then used, although rarely, in instances where the sulphate cannot be employed.

Zinc sulphate occurs in commerce in the form of fine, white-needle-shaped crystals. These crystals contain 43.90 per cent. of water in the form of "water of crystallisation." When standing in the air, the water is gradually given off, and dry sulphate of zinc remains. The dry sulphate of zinc, therefore, contains a far greater amount of zinc than the crystallized salt, for the reason that its water is being lost, which, of course, increases the zinc percentage. The amount of zinc in the crystallized and dry salts is as follows:—

	Per cent.
Crystallized zinc sulphate	22.64
Dry zinc sulphate	40.37

It has been found that the best results are obtained if a solution of zinc sulphate used for electro-galvanizing is well concentrated. It then "throws" better, and the zinc deposits more rapidly with a given voltage on account of the increased conductivity.

GRAIN STORAGE RATES UP.

THE promised jump in rates for grain storage in Montreal elevators is announced to take effect October first, much to the satisfaction of inland speculators and grain handlers, who believe that, under the increased tax, the Harbor Commission will be able to maintain the elevators for transfer purposes, as they were originally intended.

The Cabinet Council of the Government has approved the resolution adopted by the Commission recommending an increase for storage after twenty days. The new rate will be three-tenths of a cent per bushel. At the Grand Trunk elevator, a similar rate will be enforced, and the free storage decreased from thirty days to twenty. The toll for elevating grain from lake or rail carriers is to undergo a like increase.

ELEVATOR CONTRACTS LET.

THE Barnett McQueen Co., Ltd., Winnipeg and Fort William, have been awarded the contracts for the internal storage elevators to be erected at Saskatoon and Fort William. Each of the elevators will cost almost one million dollars, and the Barnett McQueen Co. was the lowest of the four tenders received. They have just completed the erection of the Government terminal elevator at Port Arthur and the work has met with the approval of the Grain Commission.

Contracts call for the completion of the elevators by December 15, 1914, so as to be in time to assist in storing the crop next year. As they each have a capacity of three and a half million bushels, this will greatly add to the storage capacity.

* * *

Fireproof Steel Cars. — In testing a steel car with a view to proving its fireproof qualities, the Pennsylvania Company placed in the car 200 lb. of shavings and wood saturated with oil, set fire to it, and allowed the mass to burn itself out. The paint and upholstery were destroyed, but no damage was done to the car as a whole. At present 2,872 steel passenger cars are in service on the Pennsylvania system, and this is about one-half of the total of steel passenger cars in service in the United States.

POVERTY NO BARRIER.

LACK of means need no longer prevent any boy from taking the first year industrial course, according to Dr. A. C. McKay, principal of the Toronto Technical School. On Dr. McKay's recommendation, the Advisory Industrial Committee of the Board of Education have decided that books, drawing instruments, science supplies and lockers should be provided free to all pupils in the first year of the industrial courses.

In recommending the change, Dr. McKay pointed out that, under present conditions, a pupil entering the course had to pay about $7 for supplies, and he declared he knew personally of many cases where the knowledge that this outlay had to be made had deterred many boys from taking the courses. He added:—

"Under the recent amendment to the Education Act, a public school pupil with fourth book standing is entitled to free tuition in the industrial courses at the Technical. This is a very fine thing, but at present there are a great many boys who, through lack of means, are unable to take advantage of the special opportunity offered to fit themselves for industrial life.

Would Fill Classes.

"Our classes now are very well attended, but we could accommodate, say, fifty more pupils, and if you carry out my suggestion it will probably go a long way toward filling the classes.

Trustee Dr. Noble called attention to the fact that the existing regulations gave the Board the power to supply books free to pupils who could not afford to pay for them. To this Dr. McKay replied that he would be unwilling to label any boy as being not so well-to-do as his fellows.

Better Have Their Own.

"Nevertheless," persisted Dr. Noble, "I think it much better that every boy should possess his own books. He is less likely to destroy them, and it may induce him to lay the foundations for a personal library. Besides, if the books are to be kept in the schools the boys will have no opportunity, as they should have, to read them at home."

The Principal assured him that the boys would be allowed to take the books home. The instruments, however, would be kept at the school.

Still unwilling to admit defeat, Dr. Noble prophesied that the Medical Officer of Health would step in and refuse to countenance the circulation of books from one set of boys to another. His gloomy prognostication, however, fell on unheeding ears, and Dr. McKay's recommendation was endorsed.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Parry Sound, Ont.—A furnace has just been started here for making pig iron.

Brantford, Ont.—The Brantford Machine and Foundry Co., Ltd., are looking for a site at Echo Place, near here.

Fort William, Ont.—The engines in the Canada Iron Corporation power house were damaged by fire on Sept. 9.

Toronto, Ont.—$6,000 damage was done by fire on Monday to the pattern shop of the Berg Machinery Co., on Bathurst Street.

Hull, Que.—Plans have been prepared for the new $50,000 foundry of A. H. Coplan, of Ottawa, and work will commence at once.

Oakville, Ont.—The council are negotiating with a stove manufacturing concern for the erection of a foundry here, to employ 50 to 60 hands.

Victoria, B.C.—The Warren Construction Co., who have received a contract for making 23 miles of road through Saanich, B.C., are buying equipment.

Ottawa, Ont.—A plant for the manufacture of mining tools and equipment is planned in Ottawa by M. J. O'Brien, of Renfrew. Plans are now in progress.

Bredenbury, Sask.—The C. P. R. are adding a machine shop to their roundhouse equipment, and are installing a stationary engine, lathe, planer and grinders.

Regina, Sask.—The Brand Stove Co., of Milwaukee, Wis., are about to build a foundry. A. L. Gordon, of Allan, Gordon, Bryant & Gordon, is representing the firm here.

Almonte, Ont.—Persons interested in a new stove works here are applying for incorporation. A building has been rented, and operations should commence towards the first of the year.

Toronto, Ont.—Geo. Gale & Sons, brass bed manufacturers, of Montreal, will build a branch factory on Logan Ave., where a site has been purchased for $30,000, measuring 200 x 298 ft.

Medicine Hat, Alta.—The Western Canada Threshing Machine Co., Medicine Hat, Alberta, is negotiating for the erection of a large plant for the manufacture of farm implements. J. E. Davies, Medicine Hat, is president.

Windsor, Ont.—The Burroughs Adding Machine Co. announce that they do not contemplate extensive manufacturing in Canada yet, and will devote their attention to filling orders without a big investment in tools and machinery. If the advantage of a Canadian branch justifies, a new plant may be built.

Sault Ste. Marie., Ont.—On the result of the Government tests to be made here in the course of a few days of the new Michaelsen concentrating machinery hang the chances of a new industry for this city which will employ 600 hands. C. O. Michaelsen, the inventor, claims that his machines will save such a large percentage of metal that the milling of low grade ores will become very remunerative. The Government will conduct the tests on copper sulphides and gold-bearing ores.

Kingston, Ont.—A plant for the manufacture of iron and steel pipe and tubing will locate here on certain conditions. The company will spend $160,000 on buildings and machinery, and employ 150 men. There will be six buildings, measuring as follows:—160 x 75, 160 x 80, 75 x 55, 60 x 50, and 40 x 25. The company's name will probably be the Kingston Iron & Tube Co. They ask the city for important concessions. Ald. Hoag is chairman of the Industries' Committee.

Electrical

Granium, Alta.—$1,000 will be raised to establish a lighting system for the streets.

Peterborough, Ont.—The Hydro-Electric Commission are rushing their construction work here.

Lachine, Que.—The Lachine Council have ordered plans to be prepared for a power house extension.

Peterborough, Ont., has been asked by the Ontario Hydro-Electric Commission to appoint an electric wiring inspector.

Winnipeg and St. Boniface are quarreling over the decision of the former to sell power and light within the confines of the latter municipality.

St. Catharines, Ont.—The cost of a Hydro-electric plant in St. Catharines is estimated by the Commission at $90,000, and $26,000 for a street lighting system.

Regina, Sask.—A start has been made to build the new power house. It will not be completed before next year. The old power house will later be used as a pumping plant.

Owen Sound, Ont.—J. Hogg, consulting engineer, says that 1,600 h.p. may be generated at Eugenia Falls in the summer, and 4,000 in winter. Development work will begin at once.

Souris, Man.—At a meeting of the town council on Sept. 3 it was decided to call tenders for an electric light plant. It is expected the system will be in operation before Christmas. A 24 hour light and power service will be furnished from the start.

Nelson, B.C.—The West Kootenay Power & Light Co. has made arrangements to increase the capacity of its power plant at Bonnington Falls, and the necessary machinery is being ordered. Nine thousand horse-power is being added to the plant.

Nelson, B.C.—The C.P.R. will use electric locomotives costing $75,000 each on its Castlegar to Rossland line. Though construction work has not yet actually started on the electrification of the line, preliminary arrangements are being made, and work will be commenced in a short time.

Sault Ste. Marie, Ont.—A contract was signed to-day whereby the Soo Dredging & Construction Company was given the work of deepening the power canal of the Lake Superior Power Co. here. The estimated cost of the work is $300,000. Several thousand horse-power will be used for manufacturing purposes.

Walkerton, Ont—The Walkerton Electric Light & Power Co. have dammed the Saugeen River and built a power house. The dam is 420 feet long, and is built of cement. The race is half a mile long, of which some 510 feet are of cement, making in all about 930 feet of solid cement work. The power-house, also of cement, is 40 feet by 50 feet, and the front of the apron is protected by interlocking steel piling 22 feet deep. The head gates are quadruple. The equipment is of the latest Swedish and German type to be obtained in Canada. The capacity of the dam at low water is about 600 h.p. The machinery installed in the power-house is capable of generating about 300 h.p., but an extra bulkhead has been constructed to accommodate a second wheel, and so double the capacity. Power is offered at the low rate of $25 per h.p.

Municipal

Alsask, Sask.—The town will purchase a fire engine, with necessary appliances, costing $6,000.

Prince Albert, Sask.—A by-law for the raising of $275,000 for the erection of a new steam power house and plant was passed by the ratepayers.

Wolseley, Sask.—The by-law to raise $14,000 for the purchase of the plant of the Central Light and Power Company of this town was passed by the ratepayers.

Calgary, Alta.—The following by-laws will be placed before the burgesses for ratification on Sept. 27: To raise $52,000 for fire department; $45,100 for parks and cemeteries; $350,000 for the establishment of Union Stock Yards, abattoirs, warehouses, and manufactories thereon; $468,900 for the constructing of level bridge across Bow River; $173,000 for concrete bridge across Bow River; $319,350 for concrete bridge across Bow River; $82,100 re steel bridge for Bow River; $82,500 re concrete bridge across Elbow River, and $173,000 re bridge at Bow River.

General Industrial

Silverton, B.C.—The Standard Mine has just installed a new air compressor.

Saskatoon, Sask.—George G. Metzner, of Toledo, O., may build a linseed oil plant here.

Aylmer, Ont.—Fire did $800 damage to machinery and supply house at the brick yard of Captain Light.

Brandon, Man.—The Everfresh Co., Ltd., of Calgary, will establish a $15,000 plant here next spring.

Regina, Sask.—C. E. McQuaid, of this city, says an American company will build a gas plant here.

Oshawa, Ont.—A boiler at the gas works exploded on Sept. 13 and wrecked the building. The loss was $20,000.

Aurora, Ont.—F. Smith Co., Ltd., will erect a plant here to manufacture calf meal. F. Smith, Toronto, is president.

Calgary, Alta.—The general Supplies Co. has been awarded contract by city for supplying valves and steampipes at a cost of $26,000.

St. Frances, Ont.—A paper mill is being built here, and will be operating January 1. A large shipment of machinery has been made.

Chatham, Ont.—An important deal has just been consummated here by which the Union Gas Co. secures control of the Tilbury Town Gas Co., Ltd.

Nelson, B.C.—The new powder mill of the Kootenay Explosives Co., at Granite, has commenced to manufacture at the rate of three tons of powder per day.

Saskatoon, Sask.—The Great West Textile Co. will locate a plant here to manufacture linen, etc. It will be moved from Regina. A. W. Ford, Regina, interested.

Grand Forks., B.C.—The Boundary Mining and Exploration Co., Ltd., will instal more powerful machinery for mining coal. A. E. Watts, of Wattsburg, is president.

London, Ont.—The Battle Creek Toasted Corn Flakes Co. will build, on Dundas Street, an addition to their plant measuring 40 x 90 ft., four stories, and costing $25,000.

Medicine Hat, Alta.—Warren Overpack, has bought the brick plant of the Purnal Brick Company there, and will install new machinery to increase the capacity to 100,000 bricks per day.

Montreal, Que. — An order for the winding-up of the Atlas Glass Works, Limited, has been granted, and the Quebec Savings and Trust Co. have been appointed provisional liquidators. This company, which is a new concern, has been forced into liquidation because it was unable to complete its financing. It has an indebtedness of $146,000 over its bonded indebtedness. The company was capitalized at $1,500,000.

Marine

Sarnia, Ont.—Extensive repairs are being made to the Northern Navigation freight sheds at Point Edward.

Quebec, Que.—The Harbour Commissioners' yacht Gossoon, a new craft 30 ft. long, was burned recently, and will be replaced.

Toronto, Ont.—V. T. Bartram, dredging contractor of Toronto, lost a dredge worth $25,000 in the St. Lawrence River last week. He also lost two scows worth $8,000 each. His loss is only partly covered by insurance.

Sarnia, Ont.—A number of repairs are being made to the Northern Navigation freight sheds at Point Edward, with a view to the better handling of the freight when the big rush starts in a few weeks. The company is enlarging the big doors and making other changes.

St. Catharines, Ont.—Notices have been sent out to the farmers residing along section No. 2 of the new Welland Ship Canal whose land has been expropriated by the Government, advising them that the land required by the canal authorities must be vacated by October 1 next. Tenders have not been called for this section of the work, but will be in a few days' time. The filing of notices to vacate is taken as an indication that work will commence very shortly on this part of the canal.

Contracts Awarded

Lindsay, Ont.—The firm of J. G. Edwards have been awarded the contract for steel for the Mud Lake Narrows Bridge.

Ottawa, Ont.—At a recent meeting of the Cabinet Council a contract for a new drill hall at Winnipeg was awarded to Halls-Aldinger Company of Winnipeg, for $519,000.

Ottawa, Ont.—A concrete foundation and piers in connection with the Lachine Canal at St. Gabriel, to cost $14,433.75, will be built by K. A. Morrison, of Ottawa, for the Government.

Swift Current, Sask.—The Ambursen Hydraulic Construction Co., Montreal, has been awarded the contract for the construction work on the new dam across the Swift Current River.

Ottawa, Ont.—John A. Donovan and W. A. McCarthy, of Belleville, were awarded the contract for a new swing bridge over the Rideau Canal, to cost $10,380, by the Government.

Winnipeg, Man.—J. G. White & Co., of New York, have been awarded a contract for a new plant to cost $5,000,000, for the Winnipeg Electric Railway Co. on the Winnipeg River at Grand Bonnet Falls.

Fort William, Ont.—P. J. Tharle, of the local constructing firm of Crockett & Tharle, announces that the firm have been awarded the contract to build a million dollar addition to the parliament buildings in Ottawa.

Winnipeg, Man.—The Board of Control has awarded the Canadian Westinghouse Co. the contract for supplying three generators for the municipal power house at Point du Bois. The contract price is $103,800.

Winnipeg, Man.—The Board of Control has awarded the Linde-Canadian Refrigeration Co., Montreal, the contract for supplying a motor-driven refrigerating plant and refrigerator boxes for King Hospital. The contract price is $12,470.

Montreal, Que.—The Canadian Vickers Co., Limited, has awarded the Mc-

Arthur Concrete, Pile and Foundation Co., New York, the contract for the foundations of the new shipbuilding plant. About 750 pedestal concrete piles will compose the foundation.

Victoria, B.C.—The contract for the construction of the line of railway for the Canadian Northern Pacific from Patricia Bay to the entrance of the Songhees reserve terminals at Victoria has been awarded to A. J. Macdonald and the Nettleton, Bruce, Elsback Co., the work embracing a joint contract.

Trenton, Ont.—The contracts for the erection of a new station, a freight shed, an enclosed tank of 40,000 gallons capacity, tool house, turntable, twelve-stall locomotive house, machine and boiler house and coaling plant have been awarded to the John Metcalf Co., of Montreal, by the Canadian Pacific Railway.

Ottawa, Ont.—The tender of the Canadian Stewart Contracting Company, of Montreal, for another large section of the Toronto harbor improvement work, amounting to $5,760,000, has been accepted by the Dominion Government. A short time ago the same company was awarded the harbor dredging contract, totalling $5,250,000.

Montreal, Que.—E. G. M. Cape, New Birks building, Montreal, is the general contractor for the $1,000,000 steel works to be built at Longueuil for Armstrong Whitworth Co. The mill work will be done by Pringle & Co., Ltd., of Belleville, Ont., and the roofing and sheet metal by the Metal Shingle & Siding Co., 91½ Delorimier Avenue.

New Incorporations

Kerry & Chace, Ltd., incorporated at Toronto, capital $40,000, to carry on the business of engineers and contractors at Toronto. Incorporators: John G. G. Kerry, William G. Chace, etc., Toronto.

The Gaspe Steam Ship Co., incorporated at Quebec to construct, own, etc., tugs, barges, etc., at Quebec, P.Q., with $100,000 capital. Incorporators: Edouard Bouchard, Francois Bouchard, etc., Quebec.

The Castings of Ottawa Co., has been incorporated to manufacture iron and steel articles; $40,000; by James Oliver, Alexander Campbell, William A. L. Oliver, and Harry M. Lee, all manufacturers of Ottawa.

Hawkesbury Board & Paper Mills, Ltd., incorporated at Ottawa, capital $2,000,000, to carry on the business of manufacturers of lumber, etc., at Montreal. Incorporators: Aubrey H. Elder, Samuel T. Mains, etc., Montreal.

Building Notes

Toronto, Ont.—A six-storey, reinforced concrete building, 206 feet wide and 200 feet long, is to be erected on the northwest corner of Dupont and Christie Streets by the Ford Motor Car Co. at a cost of $250,000.

Wood-Working

Sault Ste. Marie, Ont.—Fire did $15,000 damage to the mill of the Sims Lumber Co., Bay Street, on Sept. 11.

Robertson, Que.—The saw mill of Geo. Pousseau, at Robertson Station, on the Quebec Central Railway, was destroyed by fire on Sept. 9. The loss is about $4,000.

Jonquiere, Que.—The window and door factory of the Jonquiere Manufacturing Co., Limited (Marois & Girard), destroyed by fire recently, was valued at $20,000, and only about $4,000 insurance was carried. The fire throws about fifty people out of employment.

Railways--Bridges

Shelburne, Ont.—The by-law to provide for the construction of waterworks for the village by issue of debentures for $12,000 was carried by the burgesses.

Port Coquitlam, B.C.—Equipment and boarding cars of the Hamilton Bridge Co. have arrived for work on the construction of the triple-track bridge over the Coquitlam River.

St. Catharines, Ont.—The C.N.R. has informed the City Council that it is not ready yet to build a line from Toronto to Niagara, and so cannot co-operate with the C.P.R. and the city in building a bridge across the old Welland Canal.

St. Catharines, Ont.—The Galt & Preston Electric Railway will build a fast electric line from Hamilton to St. Catharines in conjunction with the C.P.R. Norman M. Todd, president, met the City Council on Friday night and laid his plans before them.

Tenders

Aurora, Ont.—Tenders addressed to the Town Clerk of the Corporation of Aurora will be received until September 24, for the supply of fire pumps, motors, auxiliaries, etc.

Regina, Sask.—Tenders will be received up till the 1st of October, 1913, for supplying equipment for power house. Plans and specifications may be obtained from E. W. Bull, superintendent of Light and Power Commission.

Toronto, Ont.—Tenders will be received up till September 23 for supplying fire alarm boxes, ten-circuit protector board, eight-circuit storage battery board, motor generator set, three full joker sets, copper wire, etc. Plans and specifications may be obtained from the Board of Control. H. C. Hocken, chairman.

Water-Works

Shelbourne, Ont.—This town will spend $12,000 on a waterworks system.

Winnipeg, Man. — Winnipeg City Council has passed a $13,000,000 by-law for the construction of a water system from Shoal Lake.

Crowland, Ont.—A private company is being formed to lay pipe in this district and purchase water from the Welland Commission should the latter deem it inadvisable to expend money for that purpose.

Personal

C. H. Emerson, industrial commissioner of Brantford, Ont., is understood to have resigned.

Geo. Condon has accepted an appointment with the National Steel Car Co., Ltd., of Hamilton, Ont., to represent them in Montreal.

Mr. Ruhl, district engineer of the C.P.R. at Farnham, Que., was presented by the employees with a gold watch on leaving for a new post at New Glasgow, N.S.

Captain Fred. Smart, expert dredgeman, has just returned to Sarnia from Montreal, whither he went for a conference with A. W. Robinson, consulting engineer for the Imperial Government of India, preliminary to going to Glasgow, Scotland, where he will spend six or seven weeks superintending the construction and shipping of an extensive dredging outfit to Bombay, India.

Trade Gossip

The Storey Pump and Equipment Co., Montreal and Toronto have been appointed agents for the Morris Machine Works, Baldwinsville, N.Y., makers of centrifugal pumps.

The Collingwood Shipbuilding Co. held its annual meeting on Wednesday, Sept. 3. The directors of the past year were re-elected. Prospects for the coming year were reported promising.

The Philosophy of Patternmaking.—Toronto Board of Education has for several years imported woodworking machinery free of duty under the classification of philosophical apparatus, but it is now ruled dutiable by the Customs Department.

The William P. McNeil Co., New Glasgow, N.S., have announced a change of name to that of the Maritime Bridge Co., Ltd. The executive and directorate of the new firm is as follows:—Executive — Walter McNeil, president; Kenower W. Bash, vice-president and manager; Robert C. Grant, secretary. Directors—Francis C. McMath, president Canadian Bridge Co.; Phelps Johnson, president Dominion Bridge Co.; G. H. Duggan, general manager Dominion Bridge Co.

The Smart-Turner Machine Co., Hamilton, Ont., have recently received the following orders:—The Canadian Carbide Co., St. Catharines, Ont., Centrifugal Pump; McGregor & Co., Caledonia, Ont., Duplex Pump; F. L. Snively, Dunnville, Ont., Duplex Pump; The Barnett-McQueen Co., Fort William, Ont., Automatic Feed Pump and Receiver; the Aylmer Canning Co., Aylmer Canning Co., Aylmer, Ont., Duplex Pump; The Great Lakes Dredging Co., Port Arthur, Ont., Duplex Pump; The Imperial Oil Co., Sarnia, Ont., Power Rotary Force Pump.

J. L. Kilburn, K.C., Owen Sound, has become a large stockholder in the Canadian Malleable Iron Co. The plant will be doubled in capacity at once. Tenders are being furnished. It is understood that a large contract has been placed with, by one of the leading car companies for half the output of the plant. H. A. Gutenbust, president and general manager, has had experience in the largest malleable iron plants in America, which will be of intrinsic value to this enterprise. It is stated on good authority that the castings turned out in the past six months have met the expectations of manufacturers in Canada.

Henry J. Fuller, president of the Canadian Fairbanks-Morse Co., Ltd., has recently been appointed vice-president of Fairbanks, Morse, & Co., whose headquarters are in Chicago, Ill. Mr. Fuller will be located in New York, and will be in charge of the Eastern field. While he will continue to be president of the Canadian Fairbanks-Morse, Co., Ltd., he will reside in New York, and will attend to the Canadian end by periodical trips to Montreal. In his absence, C. G. Drinkwater, who has recently been appointed vice-president of the Canadian Co., will be in charge of sales in Canada. During his stay in Canada, which has been extended over a period of some 15 years, Mr. Fuller has taken a keen interest in all financial affairs, and now acts as director of a number of Canadian firms.

Catalogues

The Dept. of the Interior, Bureau of Mines branch of the U.S. Government has published Mineral Technology Bulletin No. 53, entitled, "Mining and Treatment of Feldspar and Kaolin."

The Whitman & Barnes Mfg. Co., Akron, Ohio, have sent us a folder describing their "W. & B." screw and drop forged wrenches. The various types and sizes are illustrated and particulars given of special sets for various purposes. Copies may be had by writing.

The Skinner Chuck Co., New Britain, Conn., have issued a new catalogue and price list of the various types of chucks which they manufacture. A general specification is given of each type of chuck, together with principal dimensions and prices. The catalogue is fully illustrated, and is got up to fit loose leaf price books. Copies may be had on application.

Silent Influence

¶ Let us take a peach stone and drop it in the earth. We watch the soil with growing impatience for weeks and yet remain unrewarded with any appearance of life. We tire and forget.

¶ Nature, however, is infinitely patient, and in due time a sturdy tree blossoms and bears fruit on the spot where our hopes shrivelled up and died.

¶ It's the same way with advertising. There are some men who dig up their peach stone before it has had time to sprout. They fail to observe the silent growth, the hidden work and the subtle influence of the mighty force they have set in motion.

¶ They do not recognize the occasional inquiry as being simply the outward evidence of a potent work beneath the surface. It takes something more than a superficial examination to reveal the fact that the producing of inquiries is advertising's least important function.

¶ Let us be careful and unprejudiced in our analysis and we will discover and value at its true worth the real work that advertising performs—the standardizing of our name—the establishing of confidence in our product—the cementing of connection and the simplifying and minimizing of our salesmen's work. Then, instead of criticizing advertising we would do all we could to make its work more effective.

¶ An advertiser said to us a few months ago—"I simply haven't any time to devote to writing advertisements."

¶ "What takes up your time?" we asked.

¶ "Oh, correspondence and detail work," he said.

¶ "Listen," we said. "Correspondence is important, and detail necessary, but your advertising is more important and necessary than either. Unless your advertising is good it creates an unfavorable or negative impression, and you cannot afford that. If you make it good it will be the most effective agency you could possibly employ. It would pay you to take an hour or, if necessary, a day, once a month, to write your advertising."

¶ This advertiser took our advice, and is now reaping the benefit of it. Several good inquiries have been received, but this manufacturer emphatically states that it is the general effect of his advertising that has impressed him most. His salesmen all report favorably and state that the advertising is being read and referred to in their interviews with prospective customers.

¶ Take that old doubt and pessimism about advertising and file it to come up a year hence. Help your advertising along, study it, spend a little more time and money on it and at the end of a year when your old doubt and pessimism is laid on your desk you'll blush in shame and slam it in the waste basket.

Canadian Machinery & Manufacturing News

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.

143 University Avenue, TORONTO

us a copy of centrifugal pump catalogue "A" containing illustrations and particulars of centrifugal pumps for various purposes. Tables giving the principal dimensions of each size are included, also some useful information about speeds of pumps. Copies may be had by writing.

Heenan & Froude of Canada, Ltd., Montreal, have published a book describing the "Heenan" Refuse Destructor. Several excellent photographs are shown of plants installed in Canada and other countries, and the subject of garbage disposal is treated at length. The catalogue is printed in clear type, and is a creditable production. Laurie & Lamb, Montreal, are the managers for this company.

The Hawley Down Draft Furnace Co., Easton, Pa., are making a special offer to supply their No. ½ Hawley-Schwartz Metal Melting Furnace to small brass foundries, or to large foundries as an additional equipment for rapid production of special castings, etc. On a former occasion a detailed description of the Hawley-Schwartz furnace was given in these columns; it is, therefore, unnecessary for us to dwell on the well-known merits of the apparatus, further than to point out that the furnace can be started up or shut down at short notice, or operated continuously, and that the low initial cost of installation, the small floor space required, and simplicity and economy of operation, contribute to its adaptability to foundry plants generally.

Personal

Thomas A. Edison, the inventor, is ill at his home in Llewellyn Park, N.J.

Wm. C. Willard has been appointed Assistant Professor of Railway Engineering at McGill University, succeeding Professor Smart, resigned.

Hilder Daw, C.E., has been retained by the city of Sherbrooke, Que., to revise the present plans and design of drainage and purification system for that city.

Wm. Brownhill Smith, a member of the Electrical Committee of Glasgow, Scotland, where a municipal electrical plant is about to be constructed, costing over a million dollars, is traveling in Canada making a preparatory inspection of provincial and municipal electric power systems.

R. G. Black, consulting engineer, has been appointed a member of the Toronto Hydro-Electric Commission to fill the vacancy caused by the resignation of H. L. Drayton, K.C., some months ago. Mr. Black's appointment was made by the Provincial Hydro-Electric Commission. Mr. Black has had considerable experience in electrical management. He is a graduate of the University of Toronto, and was for some years chief engineer of the Toronto Electric Light Co. Subsequent to his resignation of this position, he spent some two years of study in the Old World, and has practised of late as a consulting engineer.

SECOND HAND MACHINERY FOR SALE

JUST AS YOU were attracted by the Caption "Second Hand Machinery for Sale," so will hundreds of other men all over Canada.

WHY NOT ADVERTISE that machine of yours that is getting too small or that isn't suited to the work for which it was intended?

Let "CANADIAN MACHINERY" find a buyer for your machinery or let it find you a second hand machine if you need one. Let "CANADIAN MACHINERY" connect you with good men if you are looking for them or with a better job if you desrve one.

Let it sell for you or buy for you, be it a factory or a machine, a man or a job.

"CANADIAN MACHINERY" is the Market Place for Machinery and Metal Men. Come to it if you wish to buy or sell.

Rates for a stand in the Market Place are 2c per word first insertion, 1c per word each subsequent insertion. Each figure counts as one word.

SKEFKO
PATENT
W C

Instantaneous Self-Alignment

The key to successful bearing operation is instantaneous and frictionless self-alignment. There is one famous make of ball bearings that possesses this all important feature—SKEFKO.

This instant adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary ball bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature inherent in the bearings themselves, as in Skefko Bearings, is obvious, for the swivelling takes place on balls instead of on a solid bearing.

SKEFKO
"Self-Aligning Ball Bearings"

Eliminate friction, reduce wear, obviate repairs, increase the life of machines, require a minimum of attention and cut down maintenance cost.

Skefko Self-Aligning Double Row, Double Capacity, Double-Life Ball Bearings cost no more than ordinary bearings, and are made in international standard sizes. Their use is practical under any load and speed condition.

We can show you where Skefko Ball Bearings will save power, attention and lubrication, and simultaneously increase your output and improve the quality of your work.

Your best interests demand that you investigate.
Ask us for "Skefko Bulletins."

MOTOR MANUFACTURERS

IMPORTANT FOR IGNITION GLOBE Motor Manufacturers. For the purpose of actualizing the Canadian patent M. R. Matti No. 137772. "Arrangement for changing the moment of fuel injection into the combustion chamber during the run of the motor and for regulating the quantity of fuel," we are looking for a connection with Canadian machine factories. The above invention is also excellently suitable for boat motors, being directly reversible through pre-ignitions. Motor manufacturers, which take interest in acquiring this already for several years proved construction without competition, apply to Stora Kopparbergs Bergslags Aktiebolag, Falun, Sweden.

BABBITT METALS FOR BEARINGS.

IN the course of a paper on bearing metals, read before the American Society for Testing Materials, Mr. T. D. Lynch, as the result of a series of tests on Babbitt metals, arrived at the following conclusions:—

(1)—The number of compositions of Babbitt metals should be as few as possible, preferably one of the tin-base and one of the lead-base, and each should be made the best of its class.

(2)—The constituent metals must be of superior grade, carefully tested and inspected, since the first requisite is a good raw material.

(3)—The alloying or smelting is of vital importance, and must be so done that the high and low melting point metals may be properly alloyed far below the melting point of some of the component parts. A temperature of 500 deg. C. and less has been found to be sufficient to obtain satisfactory alloying of Babbitt metal. The melted metal should at all times be kept covered with powdered charcoal or other protection from oxidation.

(4)—Pouring the Babbitt too cold tends to produce a granular or coarse crystal formation, and pouring it too hot tends to produce a softening effect. The lead-base Babbitt is not nearly as fool-proof as the tin-base, and, therefore, the range of pouring temperature is more limited. However, a pouring temperature of 460 deg. C. (450 deg. to 470 deg. C.) for both lead-base and tin-base Babbitts has been found to give excellent results.

(5)—Heating the shell to 100 deg. to 150 deg. C. before the Babbitt is poured into it tends to prevent blow-holes and similar defects, and also prevents the lining from shrinking away from the shell.

(6)—Babbitted bearings must not be jarred while the metal is solidifying, since any disturbance at this temperature tends to enlargement of the crystals and corresponding brittleness.

(7)—The matrix of the lining metal should be just stiff enough to support the hard crystals. These hard crystals should be as numerous as possible, and yet not lie on each other to cause brittleness.

(8) A Brinell hardness of 23.5 for lead-base and 30 for tin-base Babbitts has been found to give excellent results.

REMOVING ENAMEL FROM WIRE.

WITH the increasing use of enamelled wire for instrument winding and similar purposes, the following methods which have been adopted in Germany for cleaning the enamel from such wire preparatory to soldering will be of interest:

When the wire is very fine, it is a difficult matter to strip the enamel without breaking the wire. According to the "Electrician," the ends of the wire are dipped for a few seconds in boiling potash lye or in concentrated sulphuric acid, then washed with hot water and dried by dipping in alcohol. This leaves a clean surface of metal for soldering.

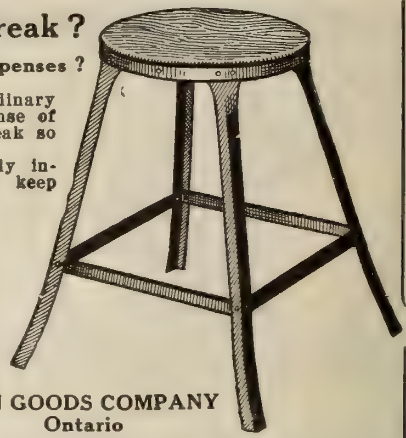
Do Your Stools Break ?

Have You Replacing Expenses ?



The trouble with the ordinary stool is the constant expense of replacing because they break so easily.

Our stools are practically indestructible and help to keep expenses down. They are just as neat in appearance as other stools plus the lifetime service and economy.

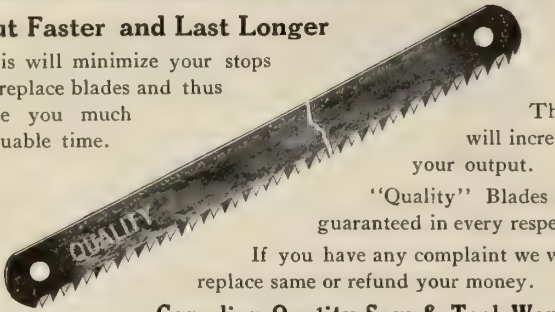
We make Wire Guards for all purposes. Tool Room Partitions.

Send a post card for full particulars and descriptions.

CANADA WIRE & IRON GOODS COMPANY
Hamilton, - Ontario

QUALITY HACK SAW BLADES

Cut Faster and Last Longer



This will minimize your stops to replace blades and thus save you much valuable time. They will increase your output.

"Quality" Blades are guaranteed in every respect.

If you have any complaint we will replace same or refund your money.

Canadian Quality Saw & Tool Works
4 St. Antoine St., MONTREAL, CANADA

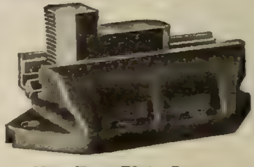
A Chuck For Every Purpose

Look Over This Complete List

Iron Body Indpendent Chucks, Steel Body Independent Chucks, Face Plate Jaws (Iron and Steel), Boring Mill Jaws (Iron and Steel), Geared Screw Chucks (Universal and Combination), Universal and Independent Two-Jaw Chucks, Geared Scroll Chucks, Drill Chucks, Planer Chucks.

Morrow Drill Chuck

It pays to send your inquiry to a manufacturer who is familiar with all types. You not only get better advice and explanations as to comparative features but often we can save initial cost by advising a lower priced chuck that will do the work.

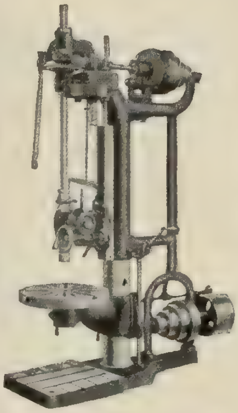


New Face Plate Jaws

Write for our 48-Page Condensed Catalog—full of distinct specifications and details, or ask regarding delivery and special service in the Dominion.

E. Horton & Son Company, Windsor Locks, Conn.

Big Drilling Capacity at Low Cost



The 14-inch "Mechanics" has proven to be one of the most practical tools on the market and our customers appreciate this by giving us their orders repeatedly. It is an adaptable, efficient, economical machine, correct in design and construction, low in first cost and upkeep expense. Furnished with "Tapping Attachment" if desired.

"Mechanics" Drilling Machines

Are built in the following models--No. 1 Friction Drills. No. 2 Friction Drills. 14 in. Standard Drills—with or without powerfeed. 20 in. Drills—all variations. 23 in. Drills—all variations. 24, 26, 28, 32 and 36 in. Sliding Head Drills. Gang Drills—14 and 20 in. Box Column Type. 23, 24, 26, 28, 32 and 36 in. in Single Column Type.

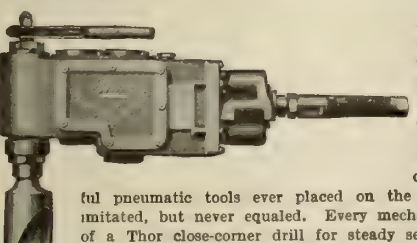
Thor CLOSE-QUARTER PISTON AIR DRILLS



Are the original Nos. 8 and 9 motors for close-corner work. The neat and compact construction of these drills, together with the design of the mechanical parts, have resulted in their becoming the most successful pneumatic tools ever placed on the market. They are often imitated, but never equaled. Every mechanic appreciates the value of a Thor close-corner drill for steady service and economy. Sent on trial. Write for prices and catalog No. 9.

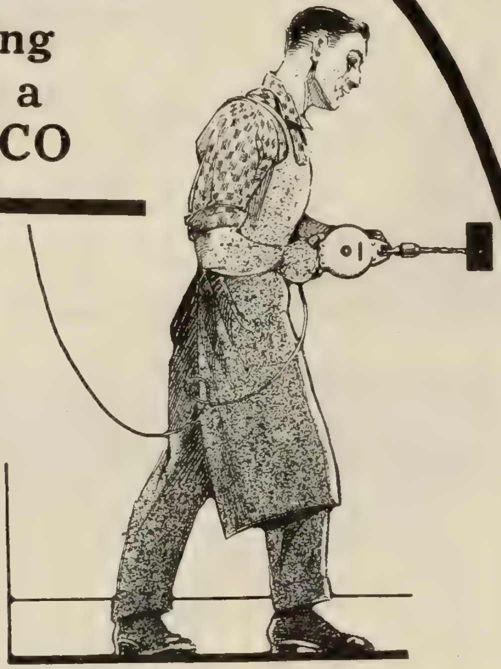
Drilling With a TEMCO



Get a **TEMCO** on trial for your machinists to try. Let them test its perfect balance half-way between the handles, the unobstructed view of the drill point, and the control-switch under the right thumb and fore-finger.

TEMCO MODEL B PORTABLE ELECTRIC DRILL

Machinists appreciate the instantaneous reverse at full speed for loosening a drill or tap that catches and the exclusive "break-over" feature that enables them to change drills by hand without using a wrench. The emery-wheel attachment which gives you a portable tool-sharpener right where it is needed, is a distinctive **TEMCO** feature of wide popularity.

The cupon makes it easy to write for catalog and details of our Try-It-Before-You-Buy-It Offer.

It Will Be To Your Interest To Attend The

Foundry and Machine Exhibition

International Amphitheatre, CHICAGO, OCTOBER, 10-17

Classification of Exhibits

Abrasive materials.
Adding machines.
Air compressors.
Belt lacing machines.
Blastmeters.
Blowers, cupola.
Boring machines, vertical.
Boring machines, horizontal.
Boring mills.
Broaching machines.
Carborundum products.
Cars, industrial.
Chain blocks.
Chucks, drill.
Chucks, lathe and planer.
Clutches, friction.
Controllers, electric.
Converters, steel.
Core machines.
Core ovens.
Cranes, electric.
Crucibles, retorts, etc
Cupolas.
Cutters, gear and milling.
Cutting-off machines and tools.
Cutting, oxy-acetylene.
Drill grinding machinery.
Drill presses, multiple spindle.
Drilling machines.
Drills.
Drills, radial.
Dust collectors.
Dynamos.
Electrical supplies.
Electro-plating machinery.
Electro-platers' supplies.
Elevators, electric.
Fans, electric and exhaust.
Factory construction material.
Fire-brick, cupola block.
Flasks, aluminum, iron, wood.
Foundry equipment, iron, brass.
Foundry supplies, etc.
Furnaces, melting.
Furnaces, annealing and tempering.
Furnaces, electric.
Gear cutting machines.
Gear hobbers.
Graphite.
Grinding tools.
Grinding wheels, alundum.
Grinding wheels, carborundum.
Grinding and polishing machinery.
Grinders, disc and surface.
Grinders, plain and universal.
Hack saw machines, power.
Hoisting and conveying machinery.
Hoists, electric, pneumatic.
Hoists, portable.
Ingot metals.
Keyseaters.
Ladle heaters.
Lathes, engine and turret.
Lathes, wood and pattern.
Lubricants.
Mch. shop tools, supplies.
Matchplates.
Milling machines, horizontal and vertical.
Mold dryers.
Molding machines, automatic.
Molding machines, hand and power.
Motors and generators.
Pattern shop machinery.
Pattern and box lumber.
Pig iron.
Planers.
Pneumatic tools.
Polishing and plating machinery.
Pulleys, metal and wood.
Punches, power and hand.
Pyrometers.
Radial drills.
Riveters, pneumatic.
Sandblast machinery and equipment.
Sandblast accessories.
Sand mixing machinery.
Saw sharpening machines.
Screw machines.
Separators, magnetic.
Shapers.
Slotters.
Sprue cutters.
Tool room grinders.
Track, industrial.
Tramrail systems.
Trolleys.
Trucks, hand and electric.
Turret machines, vertical.
Turntables.
Vertical turret lathes.
Vibrators.
Welding machines, oxy-acetylene.
Welding and cutting compounds.
Woodworking machinery.

The Reason Why

Besides the big exhibit of up-to-date labor-saving and output-increasing machines, the Annual Conventions of the Allied Foundry Associations will be held. There will be many discussions on the practice of the modern foundry or machine shop—discussions that will put you wise to things that will be the means of increasing the prosperity of **your** plant.

The Foundry and Machine Exhibition will benefit by your presence. But the benefit from experience received by our visitors will be still greater.

Come and let Chicago welcome you.

For Further Particulars Address C. E. HOYT, Secretary

FOUNDRY & MACHINE EXHIBITION COMPANY
HOTEL SHERMAN, CHICAGO

Engravers.
Pritchard-Andrews Co., Toronto.
